PHASE DIAGRAMS OF NUCLEAR REACTOR MATERIALS

INTRODUCTION

This compilation presents the phase diagrams for possible materials for nuclear reactors developed at the Oak Ridge National Laboratory over the period 1950-59. It represents the efforts of certain personnel in what are now the Chemical Technology, Metallurgy, Chemistry, and Reactor Chemistry Divisions of ORNL. This document also contains diagrams originated by other installations under contract to ORNL during that interval. In addition, a few diagrams from the unclassified literature have been included when they form part of completed systems sequences.

No general discussion of the principles of heterogeneous phase equilibrium has been included since excellent discussions are available in many well-known publications. Equilibria in several of the fused-salt systems presented below have been described in some detail in a recent publication by Ricci.¹ Nor has any attempt been made to assemble the phase equilibrium data on reactor materials available from many other sources. For such information the reader is referred to other recently published compilations of phase diagrams²⁻⁶ and to the several new works dealing specifically with nuclear reactor materials.⁷⁻⁹

While some of the diagrams presented below are the result of fundamental researches, most were obtained in support of the ORNL programs in development of fluid-fueled reactors. Others have been developed as a consequence of ORNL interests in reprocessing of nuclear fuels, reactor metallurgy, production of uranium and thorium from raw materials, and studies of mechanisms of corrosion.

Much of the research effort was devoted to searches for systems of direct use as fluid fuels or blanket materials; unpromising systems were often given only casual attention. The diagrams in this collection, accordingly, vary widely in the degree of completeness of examination. A brief description of the status of the work is presented in each case; in a few cases, where no detailed description of the system has been published, the available data have been included with the diagram.

1. METAL SYSTEMS

1.1. The System Silver-Zirconium

J. O. Betterton, Jr., and D. S. Easton, "The Silver-Zirconium System," *Trans. Met. Soc. AIME* 212, 470-75 (1958).

A detailed investigation was made of the phase diagram of silver-zirconium, particularly in the region 0 to 36 at. % Ag. The system was found to be characterized by two intermediate phases, Zr_2Ag and $ZrAg$, and a eutectoid reaction in which the β -zirconium solid solution decomposes into α -zirconium and Zr_2Ag . It was found that impurities in the range 0.05% from the iodide-type zirconium were sufficient to introduce deviations from binary behavior; with partial removal of these impurities an increase in the α -phase solid solubility limit from 0.1 to 1.1 at. % Ag was observed.

UNCLASSIFIED
ORNL-LR-DWG 18989

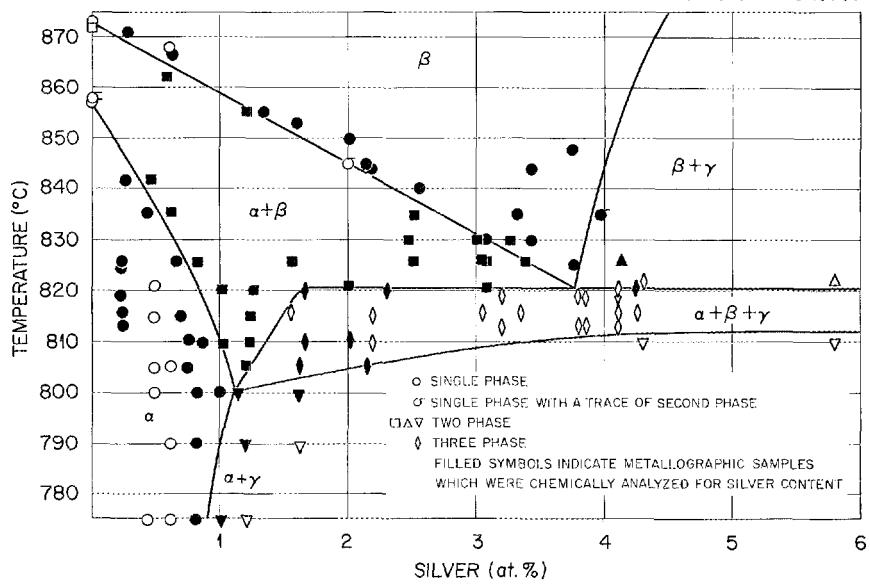

Fig. 1.1a. The System Silver-Zirconium in the Eutectoid Region (0-6 at. % Ag).

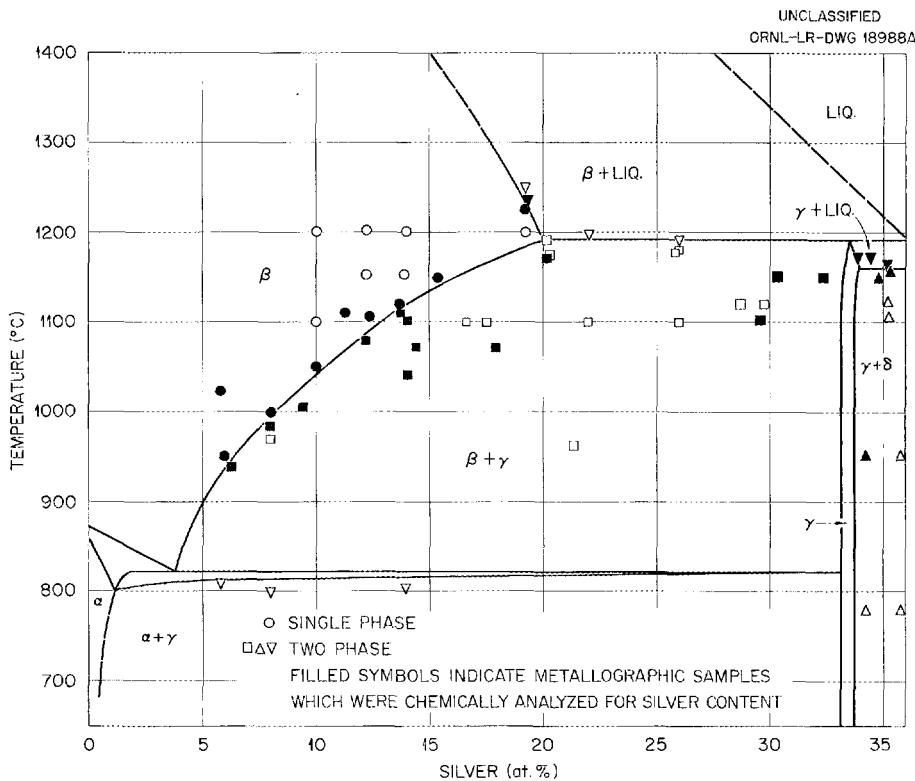

Fig. 1.1b. The System Silver-Zirconium in the Region 0-36 at. % Ag.

1.2. The System Indium-Zirconium

J. O. Betterton, Jr., and W. K. Noyce, "The Equilibrium Diagram of Indium-Zirconium in the Region 0-26 at. pct In," *Trans. Met. Soc. AIME* 212, 340-42 (1958).

The zirconium-rich portion of the indium-zirconium phase diagram was determined as a study of the effect of alloying a trivalent B-subgroup element, indium, with zirconium in group IVA. The temperature of the allotropic transition was found to rise with indium, terminating in a peritectoid reaction, $\beta(9.3\% \text{ In}) + \gamma(22.4\% \text{ In}) \rightleftharpoons \alpha(10.1\% \text{ In})$ at 1003°C. In this respect the effect of indium is analogous to that of aluminum in zirconium and titanium alloys.

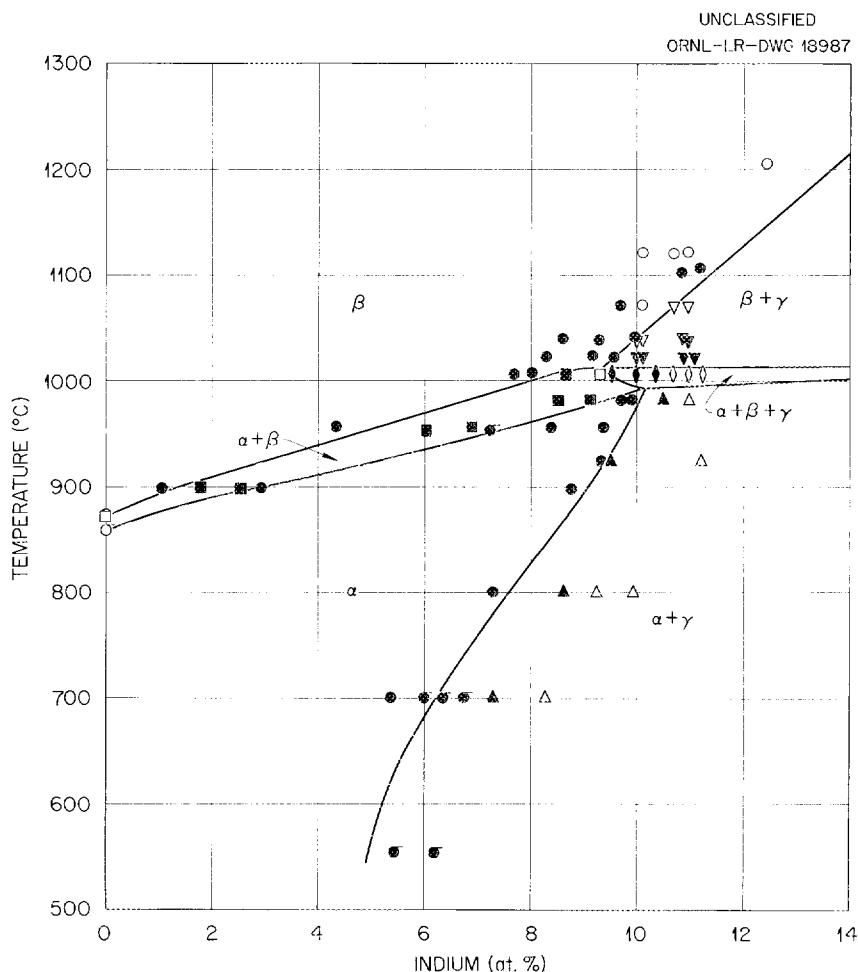

Fig. 1.2a. The System Indium-Zirconium in the Peritectoid Region (0-13 at. % In).

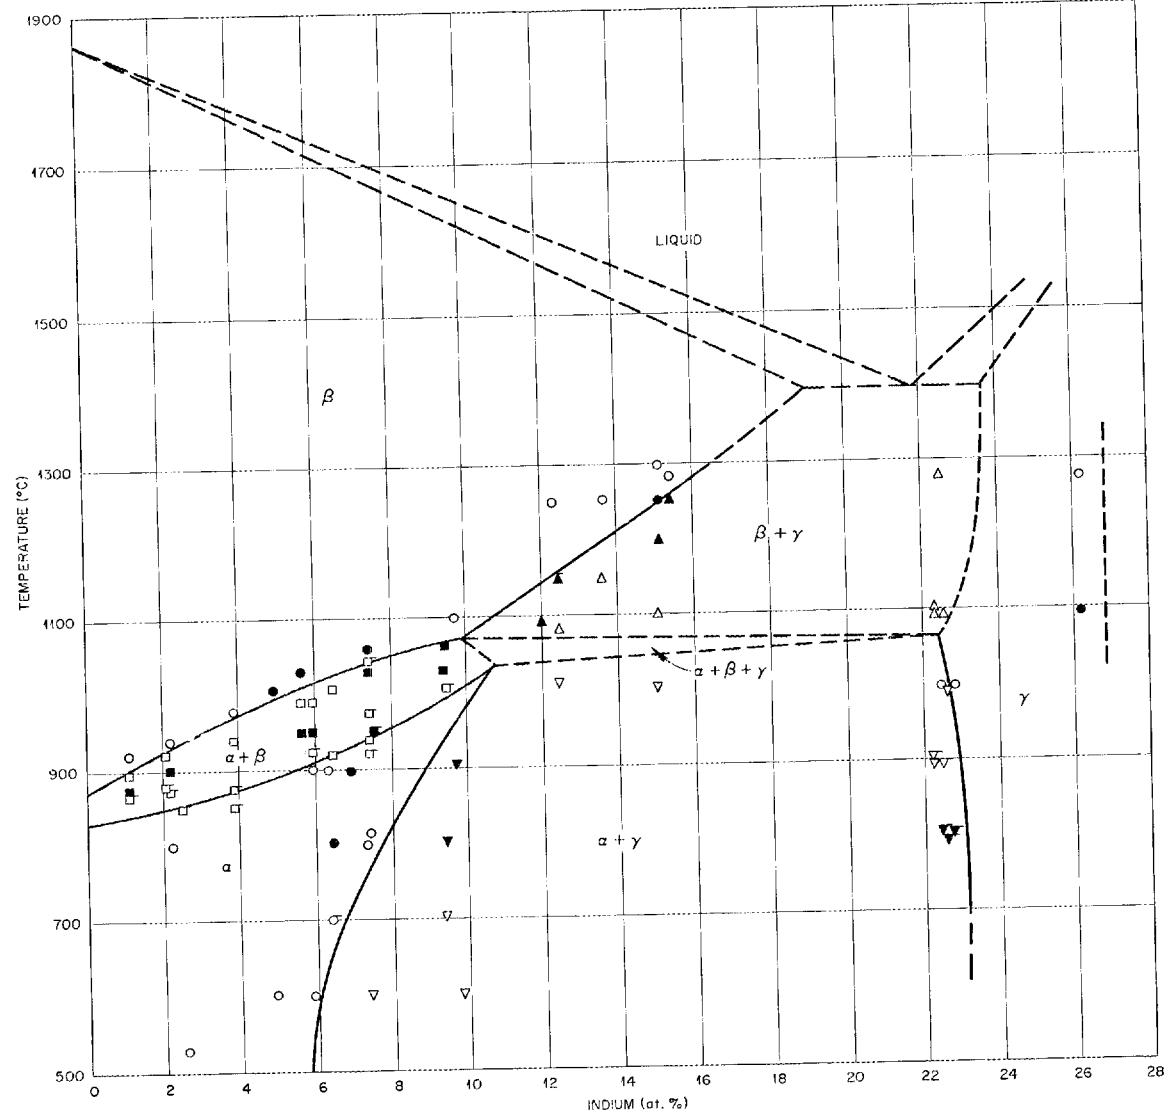

Fig. 1.2b. The System Indium-Zirconium in the Region 0-28 at. % In.

1.3. The System Antimony-Zirconium

J. O. Betterton, Jr., and W. M. Spicer, "The Antimony-Zirconium System in the Range 0 to 5 at. pct Antimony," *Trans. Met. Soc. AIME* 212, 456-57 (1958).

The solubilities of antimony in the α and β forms of zirconium were determined between 750 and 1300°C. The α phase forms by a peritectoid reaction; the $\alpha/(\alpha + \beta)$ and $\beta/(\alpha + \beta)$ phase boundaries rise in temperature with increasing antimony. Impurities in the 99.5% zirconium were sufficient to influence the phase boundaries, and the variation reported is approximate. The restricted phase solubility of the terminal zirconium phases, which is especially characteristic of this system, is thought to result from the low free energy of the Zr_2Sb phase.

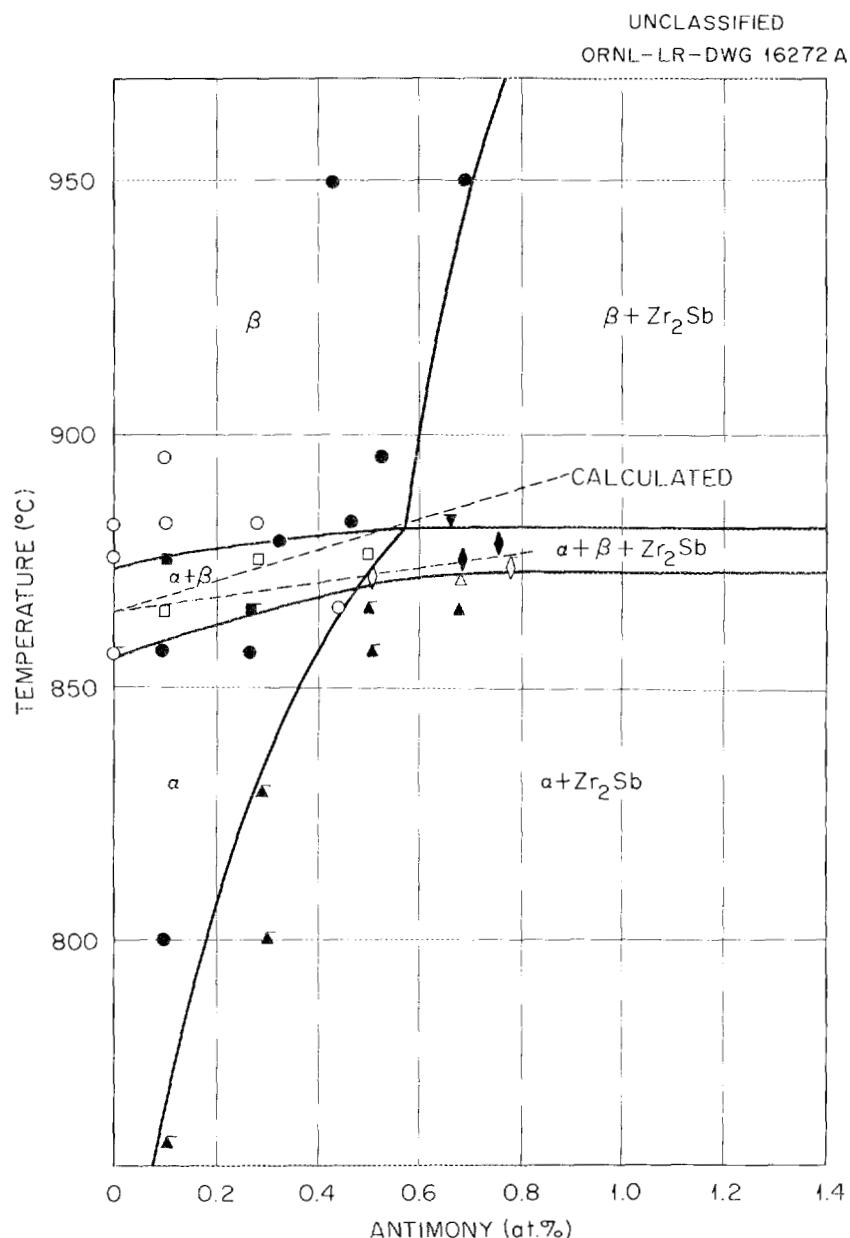

Fig. 1.3a. The System Antimony-Zirconium in the Peritectoid Region (0-1.4 at. % Sb),

UNCLASSIFIED
ORNL-LR-DWG 18983

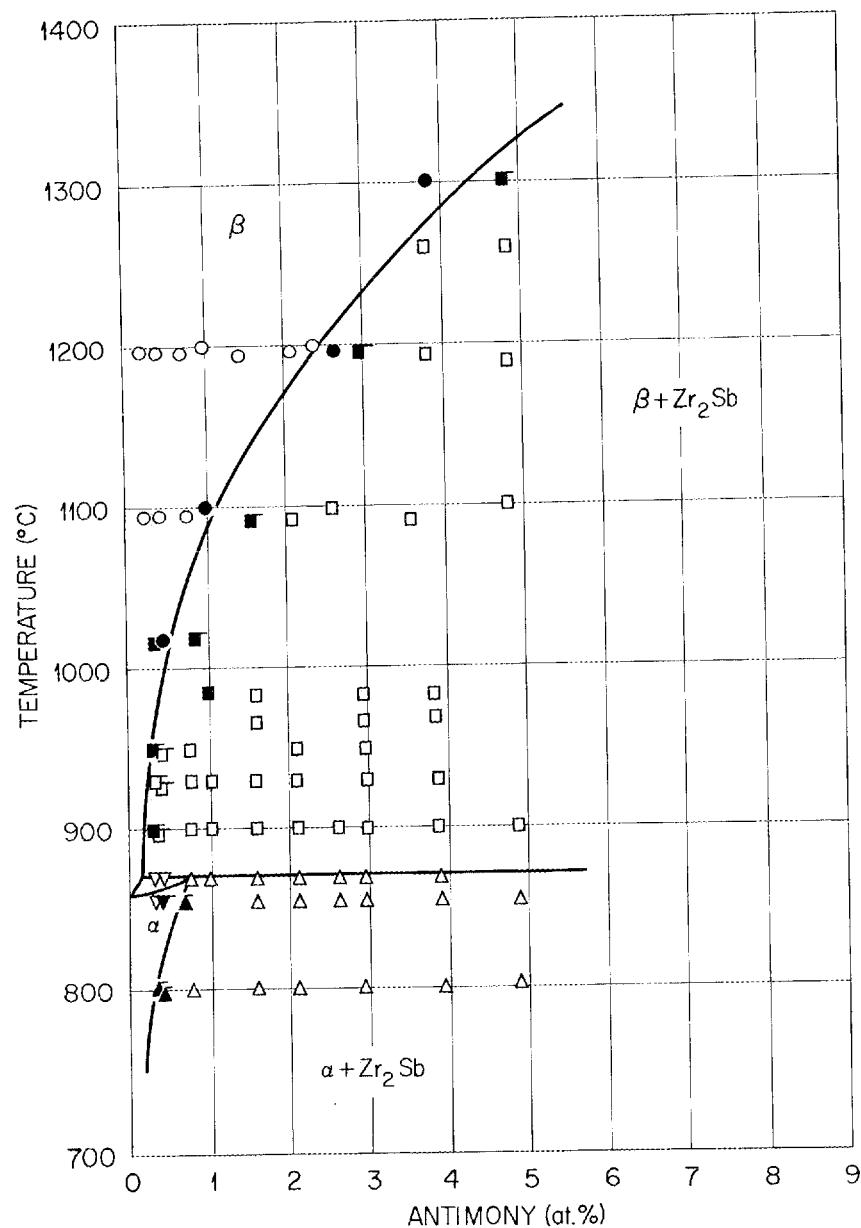

Fig. 1.3b. The System Antimony-Zirconium in the Peritectoid Region (0-6 at. % Sb).

1.4. The System Lead-Zirconium

G. D. Kneip, Jr., and J. O. Betterton, Jr., cited by E. T. Hayes and W. L. O'Brien, "Zirconium Equilibrium Diagrams," p 443-83 in *The Metallurgy of Zirconium*, ed. by B. Lustman and F. Kerze, Jr., McGraw-Hill Book Co., New York, 1955.

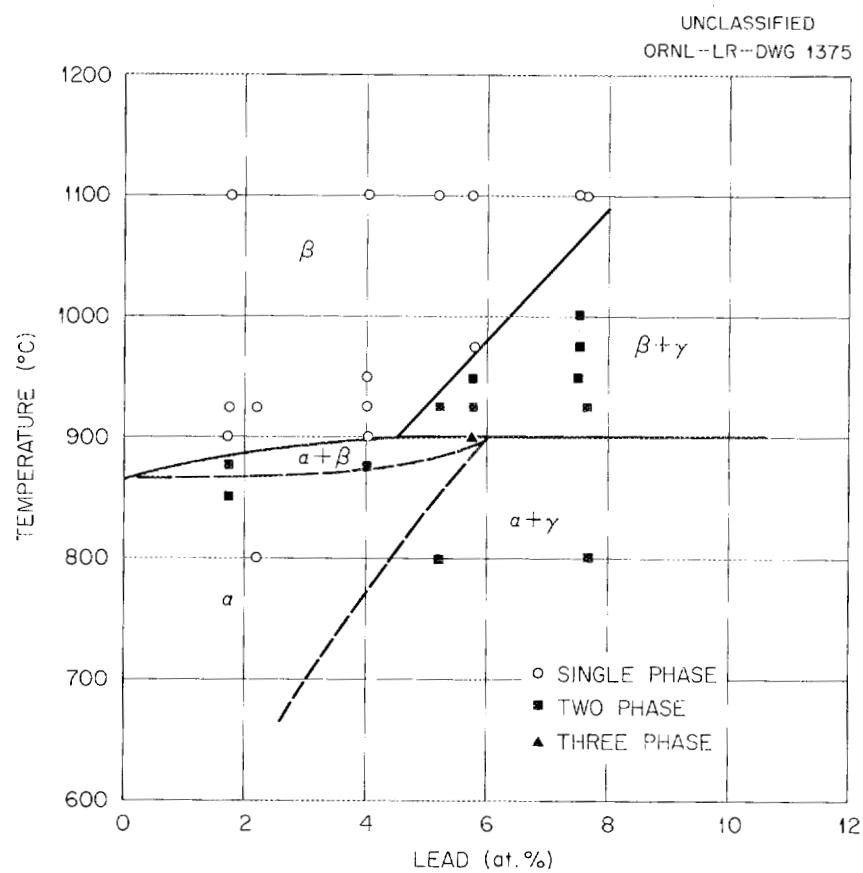

Fig. 1.4. The System Lead-Zirconium in the Peritectoid Region (0-12 at. % Pb).

2. METAL-FUSED-SALT SYSTEMS

2.1. The Sodium Metal-Sodium Halide Systems

M. A. Bredig and J. E. Sutherland, "High-Temperature Region of the Sodium-Sodium Halide Systems," *Chem. Ann. Prog. Rep.* June 20, 1957, ORNL-2386, p 119. Subsequent report on these systems to be published.

UNCLASSIFIED
ORNL-LR-DWG. 21894A

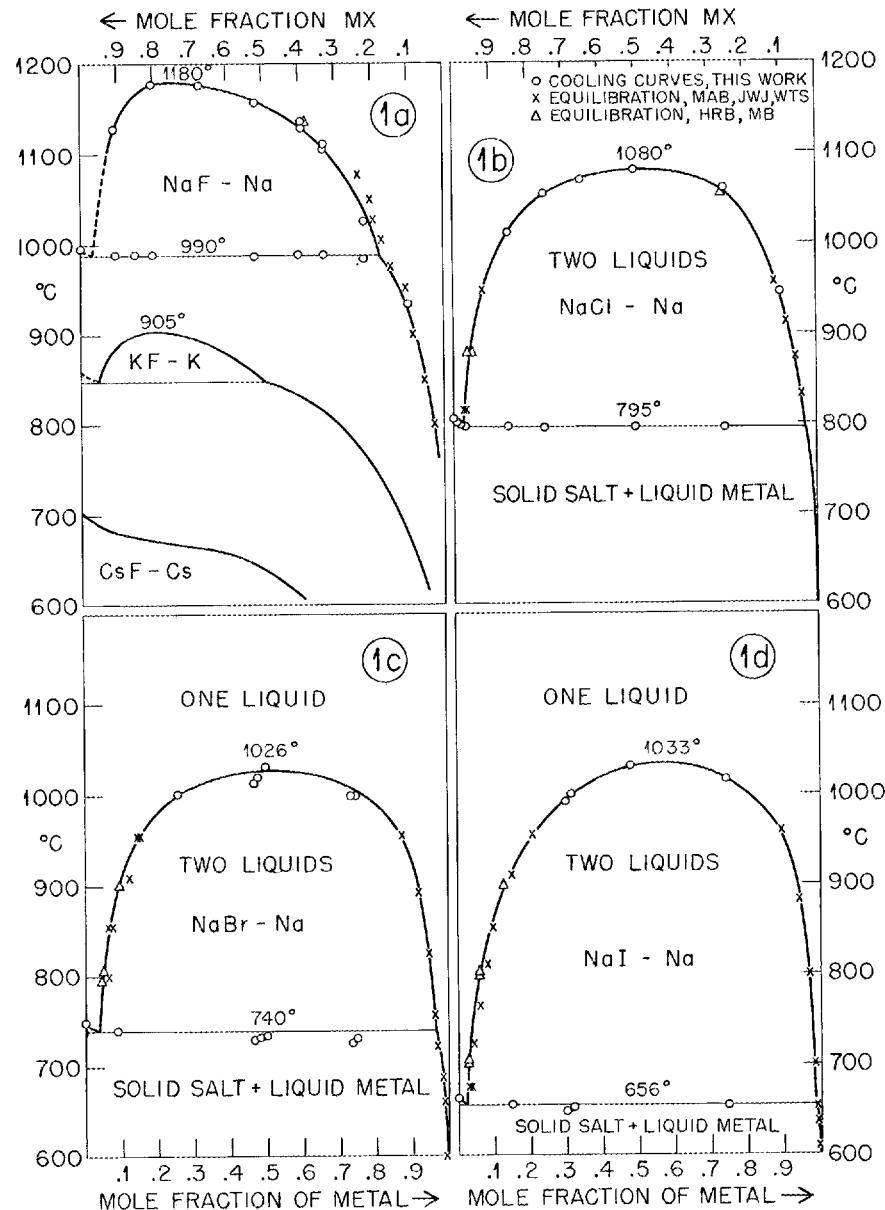

Fig. 2.1. The Sodium Metal-Sodium Halide Systems.

2.2. The Potassium Metal-Potassium Halide Systems

J. W. Johnson and M. A. Bredig, "Miscibility of Metals with Salts in the Molten State. III. The Potassium-Potassium Halide Systems," *J. Phys. Chem.* **62**, 604 (1958).

Complete miscibility of metal and salt exists in the $KX-K$ systems, $X = F, Cl, Br$, and I , at and above 904, 790, 727, and 717°C, that is, as close as +47, +18, -7, and +22°, respectively, to the melting points of the salts. The asymmetry of the liquid-liquid coexistence areas, especially of the fluoride and chloride systems, as indicated by the consolute compositions (20, 39, 44, and 50 mole % metal, respectively), is largely explained by the difference in molar volumes of salt and metal. At the monotectic temperature, the solubility of the solid salts in the liquid metal, as well as of the metal in the liquid salt phase, is much larger than in the case of the sodium systems.

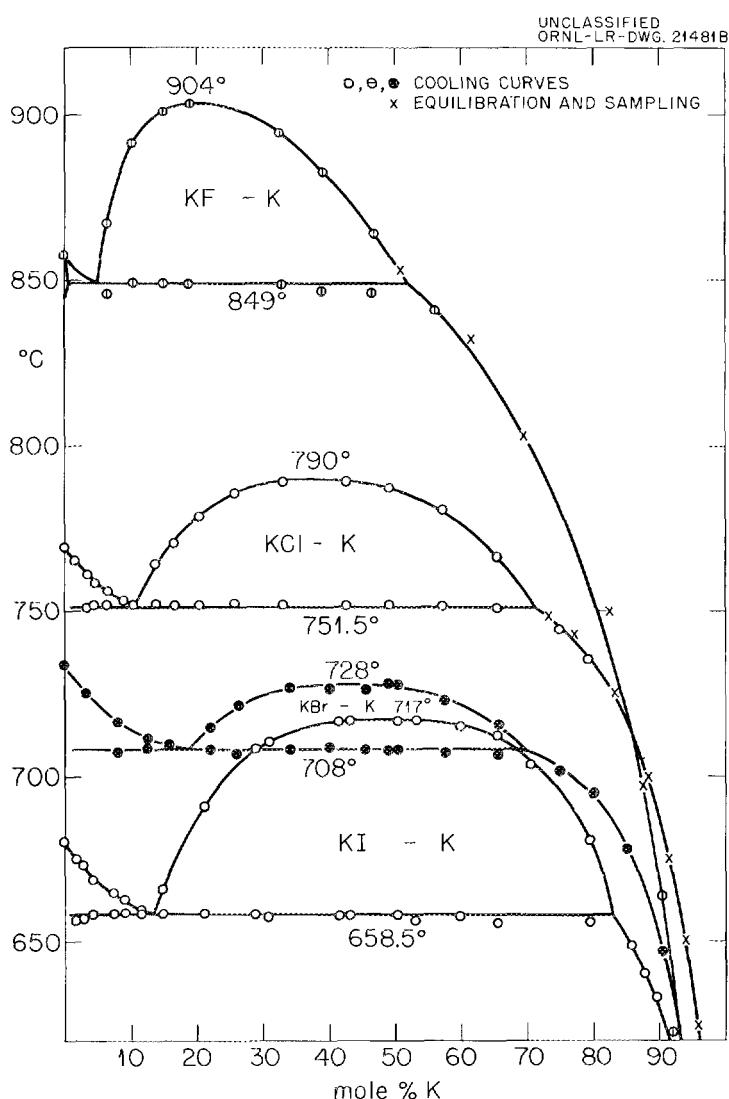

Fig. 2.2. The Potassium Metal-Potassium Halide Systems.

2.3. The Rubidium Metal-Rubidium Halide Systems

M. A. Bredig and J. W. Johnson, "Rubidium-Rubidium Halide Systems," *Chem. Ann. Prog. Rep.* June 20, 1957, ORNL-2386, p 122; M. A. Bredig, J. E. Sutherland, and A. S. Dworkin, "Molten Salt-Metal Solutions. Phase Equilibria," *Chem. Ann. Prog. Rep.* June 20, 1958, ORNL-2584, p 73. Subsequent report on these systems to be published.

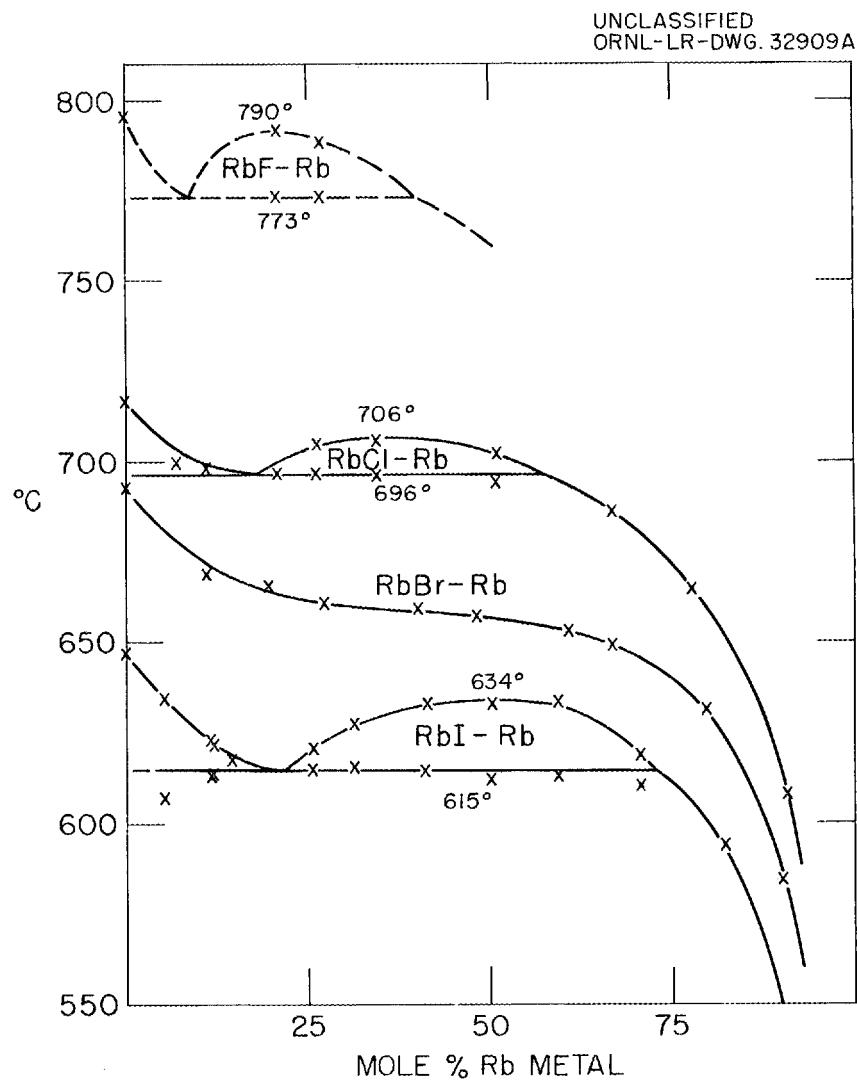

Fig. 2.3. The Rubidium Metal-Rubidium Halide Systems.

2.4. The Cesium Metal-Cesium Halide Systems

M. A. Bredig, H. R. Bronstein, and W. T. Smith, Jr., "Miscibility of Liquid Metals with Salts. II. The Potassium-Potassium Fluoride and Cesium-Cesium Halide Systems," *J. Am. Chem. Soc.* **77**, 1454 (1955).

Miscibility in all proportions of cesium metal with cesium halides at and above the melting points of the pure salts, and of potassium metal with potassium fluoride 50° above the melting point of the salt, occurs. The temperature-concentration range of coexistence of two liquid phases decreases in going from sodium to potassium systems and disappears altogether for the cesium systems. The solubility of the solid halides in the corresponding liquid alkali metals, at a given temperature, increases greatly with increase of atomic number of the metal.

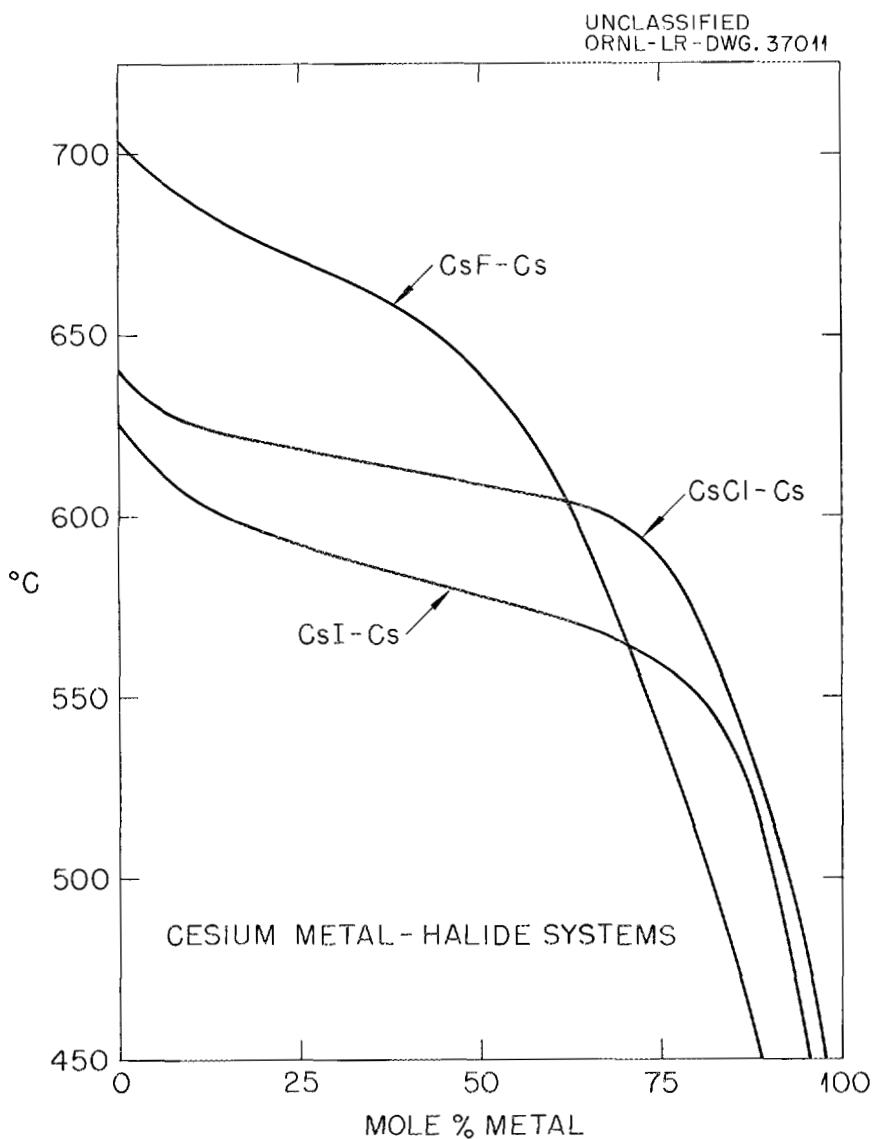

Fig. 2.4. The Cesium Metal-Cesium Halide Systems.

2.5. The Alkali Metal-Alkali Metal Fluoride Systems

M. A. Bredig, J. E. Sutherland, and A. S. Dworkin, "Molten Salt-Metal Solutions. Phase Equilibria," *Chem. Ann. Prog. Rep.* June 20, 1958, ORNL-2584, p 73.

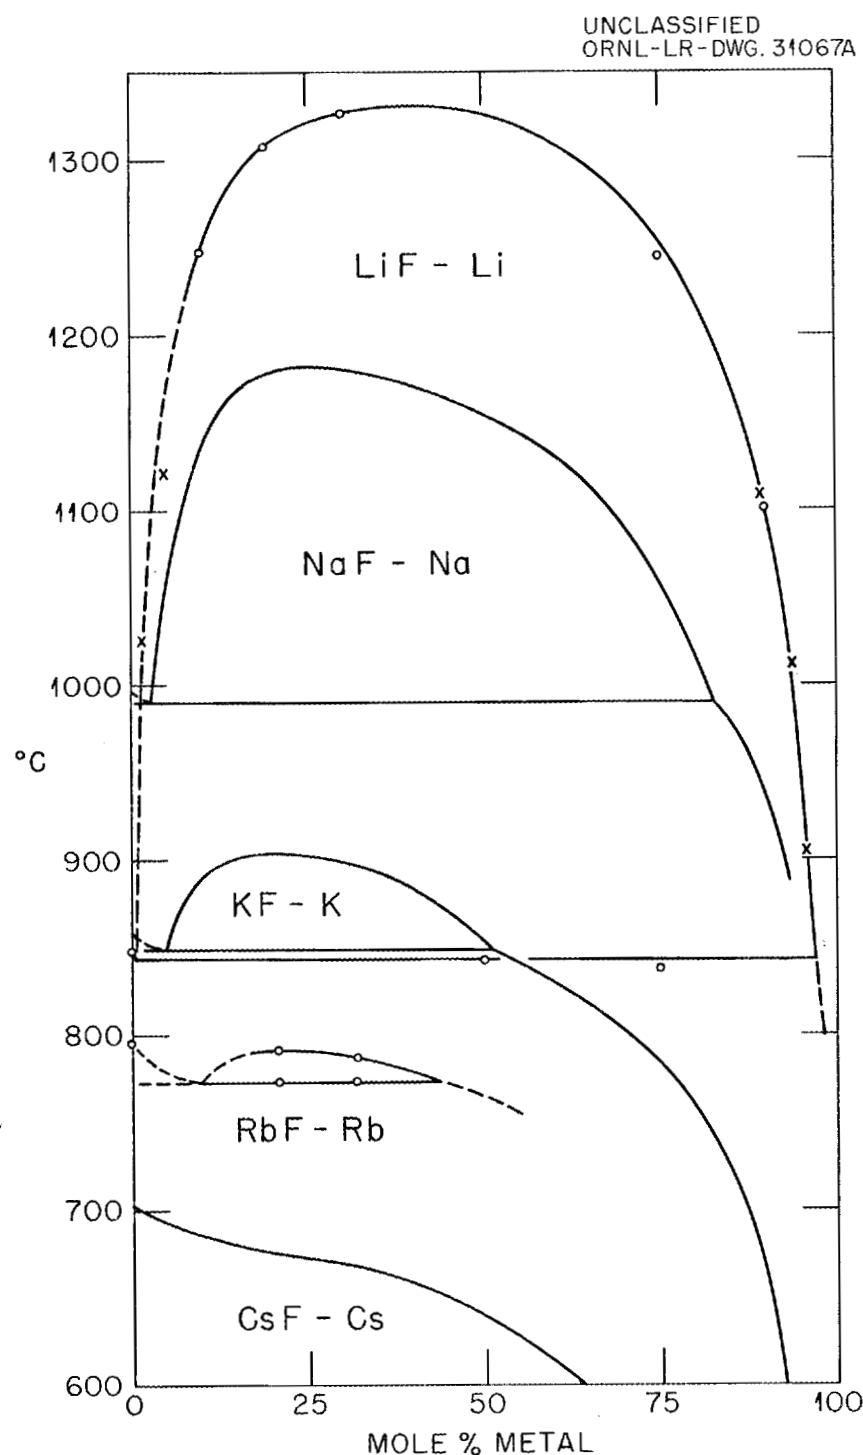

Fig. 2.5. The Alkali Metal-Alkali Metal Fluoride Systems.

3. FUSED-SALT SYSTEMS

3.1. The System LiF-NaF

A. G. Bergman and E. P. Dergunov, "Fusion Diagram of LiF-KF-NaF," *Compt. rend. acad. sci. U.R.S.S.* 31, 753-54 (1941).

The system LiF-NaF contains a single eutectic at 60 LiF-40 NaF (mole %), m.p. 652°C.

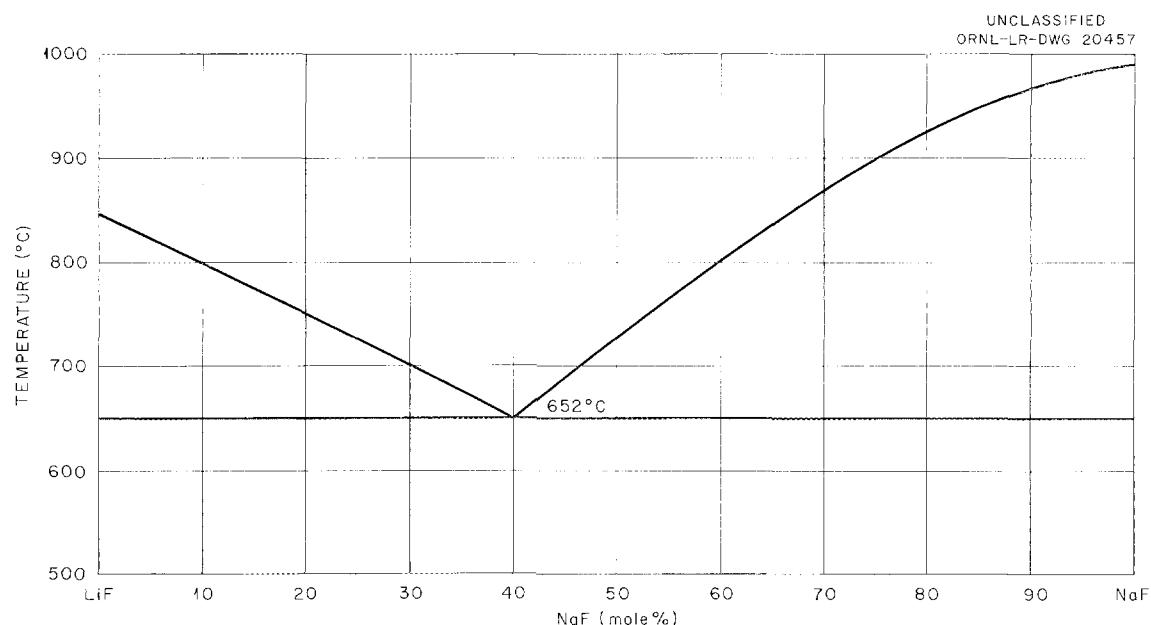

Fig. 3.1. The System LiF-NaF.

3.2. The System LiF-KF

A. G. Bergman and E. P. Dergunov, "Fusion Diagram of LiF-KF-NaF," *Compt. rend. acad. sci. U.R.S.S.* **31**, 753-54 (1941).

The system LiF-KF contains a single eutectic at 50 LiF-50 KF (mole %), m.p. 492°C.

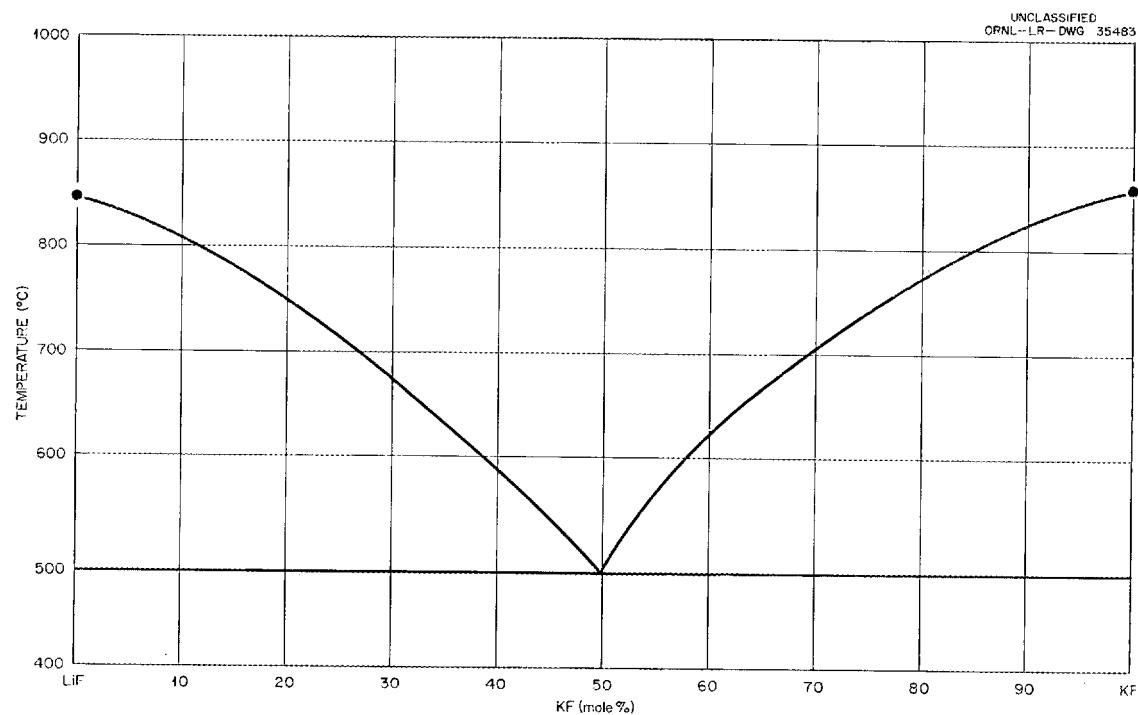

Fig. 3.2. The System LiF-KF.

3.3. The System LiF-RbF

C. J. Barton, T. N. McVay, L. M. Bratcher, and W. R. Grimes, unpublished work performed at the Oak Ridge National Laboratory, 1951-54.

Preliminary diagram.

Invariant Equilibria

Mole % LiF in Liquid	Invariant Temperature (°C)	Type of Equilibrium	Phase Reaction at Invariant Temperature
44	470	Eutectic	$L \rightleftharpoons RbF + LiF \cdot RbF$
47	475	Peritectic	$L + LiF \rightleftharpoons LiF \cdot RbF$

General characteristics of the system have been reported by E. P. Dergunov, "Fusion Diagrams of the Ternary Systems of the Fluorides of Lithium, Sodium, Potassium, and Rubidium," *Doklady Akad. Nauk S.S.R.* **58**, 1369-72 (1947).

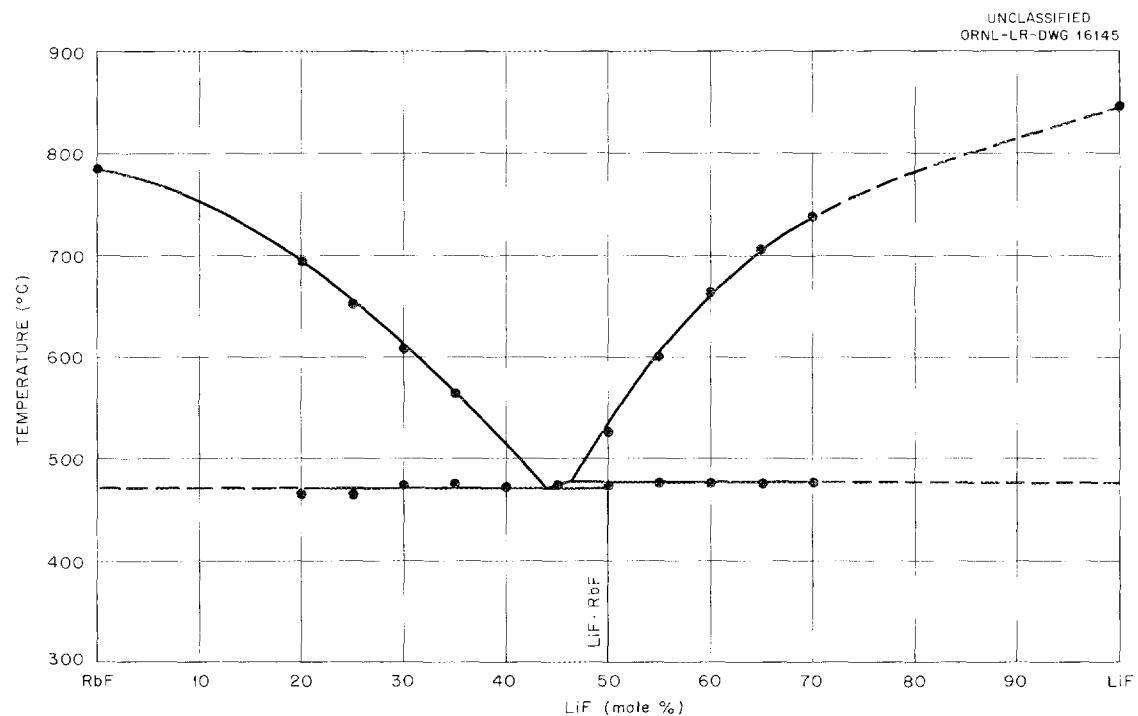

Fig. 3.3. The System LiF-RbF.

3.4. The System LiF-CsF

C. J. Barton, L. M. Bratcher, T. N. McVay, and W. R. Grimes, unpublished work performed at the Oak Ridge National Laboratory, 1952-54.

Preliminary diagram.

Invariant Equilibria

Mole % CsF in Liquid	Invariant Temperature (°C)	Type of Equilibrium	Phase Reaction at Invariant Temperature
55	495 ± 5	Peritectic	$\text{LiF} + L \rightleftharpoons \text{LiF}\cdot\text{CsF}$
63	475 ± 5	Eutectic	$L \rightleftharpoons \text{LiF}\cdot\text{CsF} + \text{CsF}$

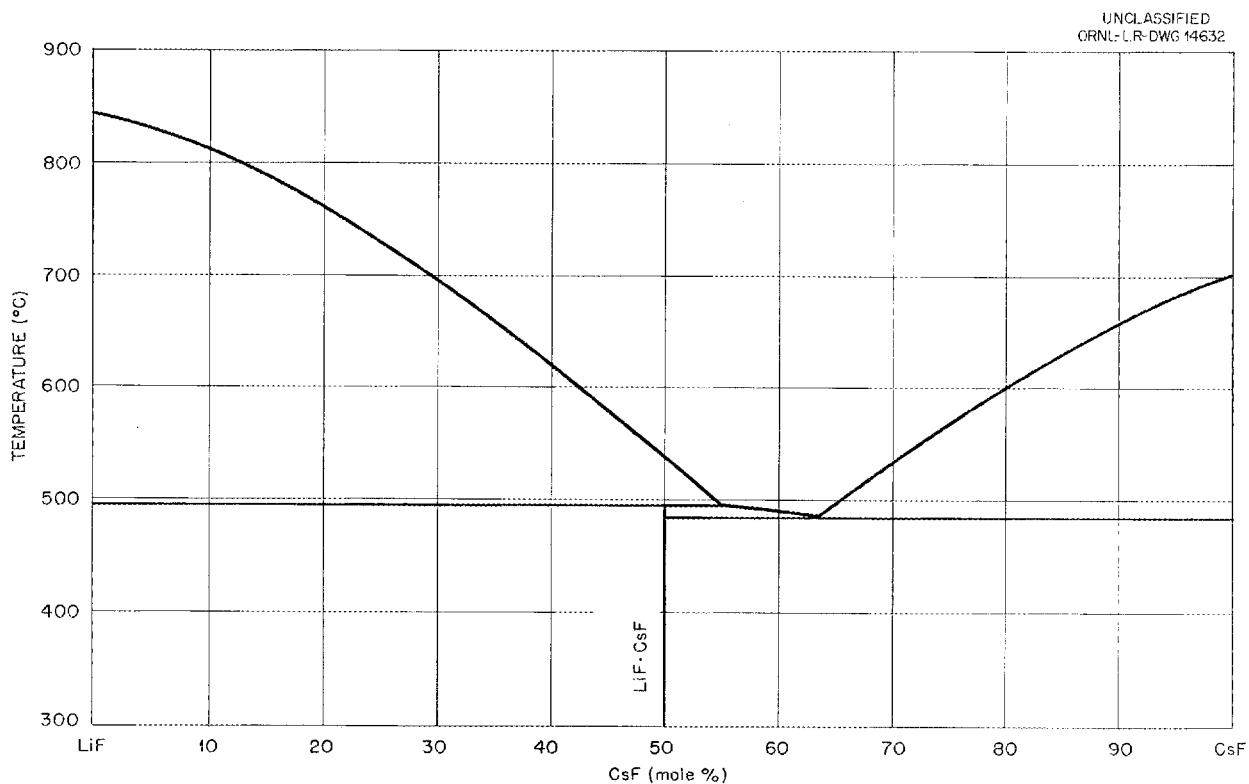

Fig. 3.4. The System LiF-CsF.

3.5. The System NaF-KF

A. G. Bergman and E. P. Dergunov, "Fusion Diagram of LiF-KF-NaF," *Compt. rend. acad. sci. U.R.S.S.* 31, 753-54 (1941).

The system NaF-KF contains a single eutectic at 40 NaF-60 KF (mole %), m.p. 710°C.

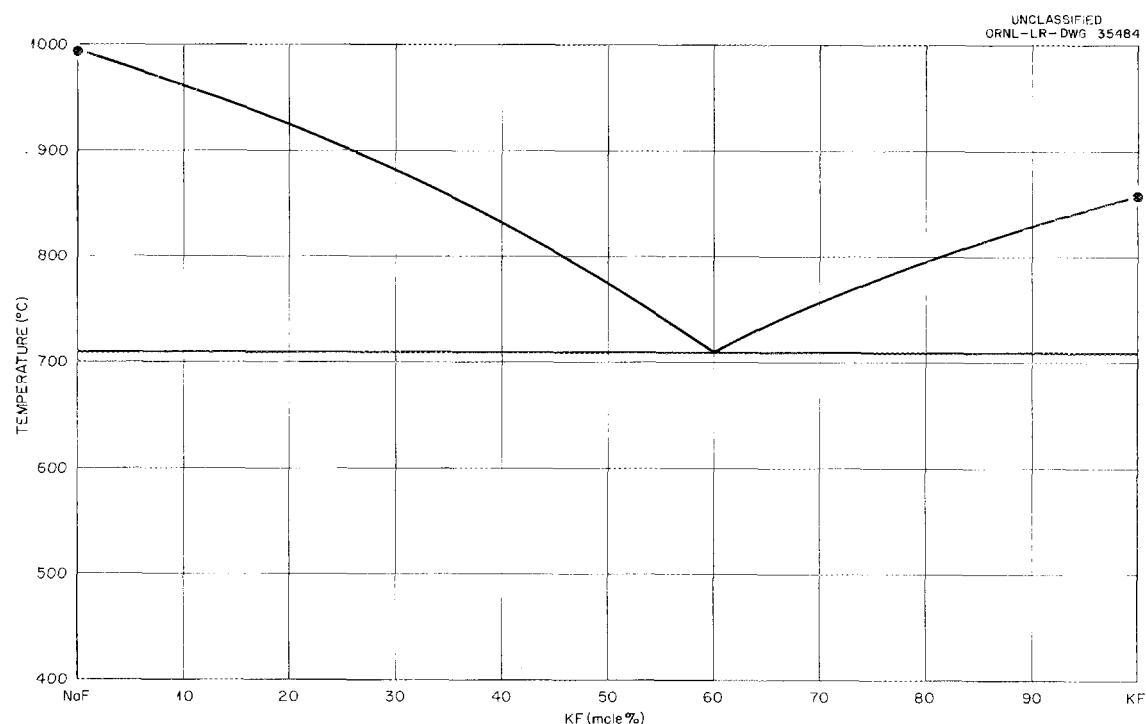

Fig. 3.5. The System NaF-KF.

3.6. The System NaF-RbF

C. J. Barton, J. P. Blakely, L. M. Bratcher, and W. R. Grimes, unpublished work performed at the Oak Ridge National Laboratory, 1951.

Preliminary diagram. The system NaF-RbF contains a single eutectic at 27 NaF-73 RbF (mole %), m.p. $675 \pm 10^\circ\text{C}$.

General characteristics of the system have been reported by E. P. Dergunov, "Fusion Diagrams of the Ternary Systems of the Fluorides of Lithium, Sodium, Potassium, and Rubidium," *Doklady Akad. Nauk S.S.R.* **58**, 1369-72 (1947).

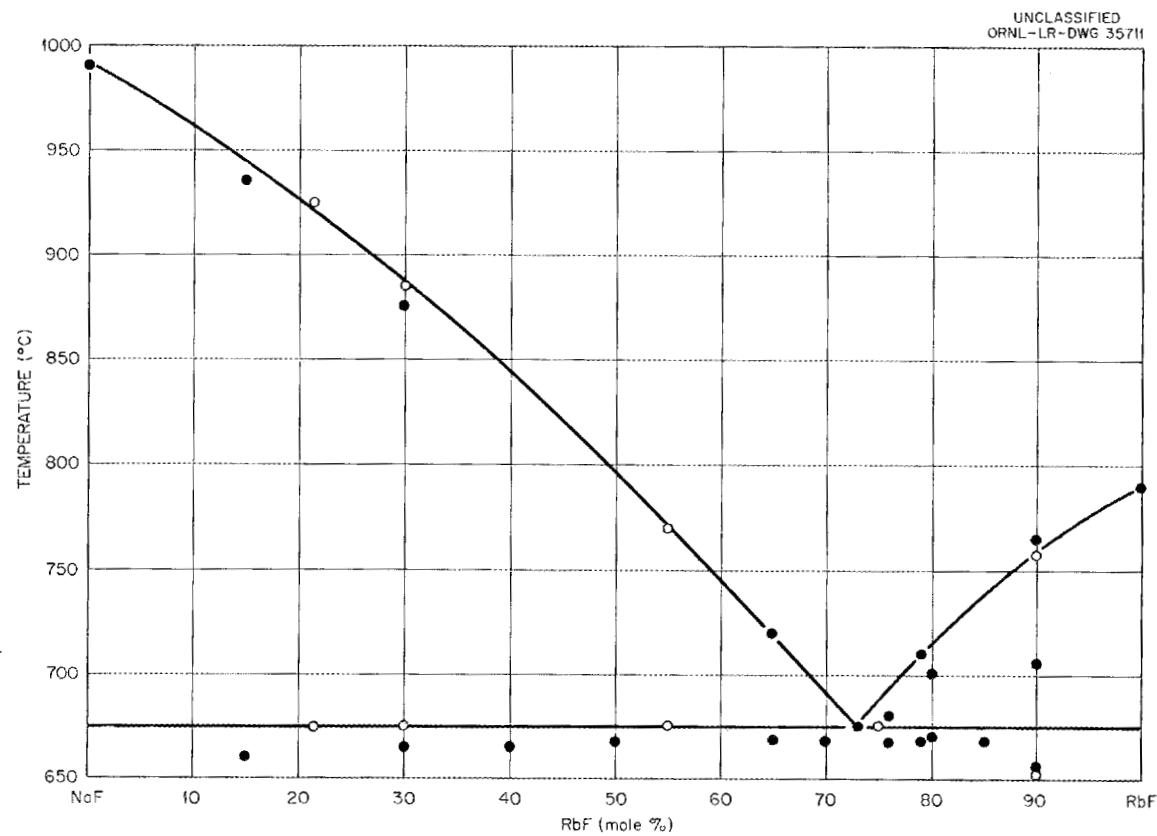

Fig. 3.6. The System NaF-RbF.

3.7. The System KF-RbF

C. J. Barton, J. P. Blakely, L. M. Bratcher, and W. R. Grimes, unpublished work performed at the Oak Ridge National Laboratory, 1951.

Preliminary diagram. The system KF-RbF contains a solid solution minimum at 28 KF-72 RbF (mole %), m.p. $770 \pm 10^\circ\text{C}$.

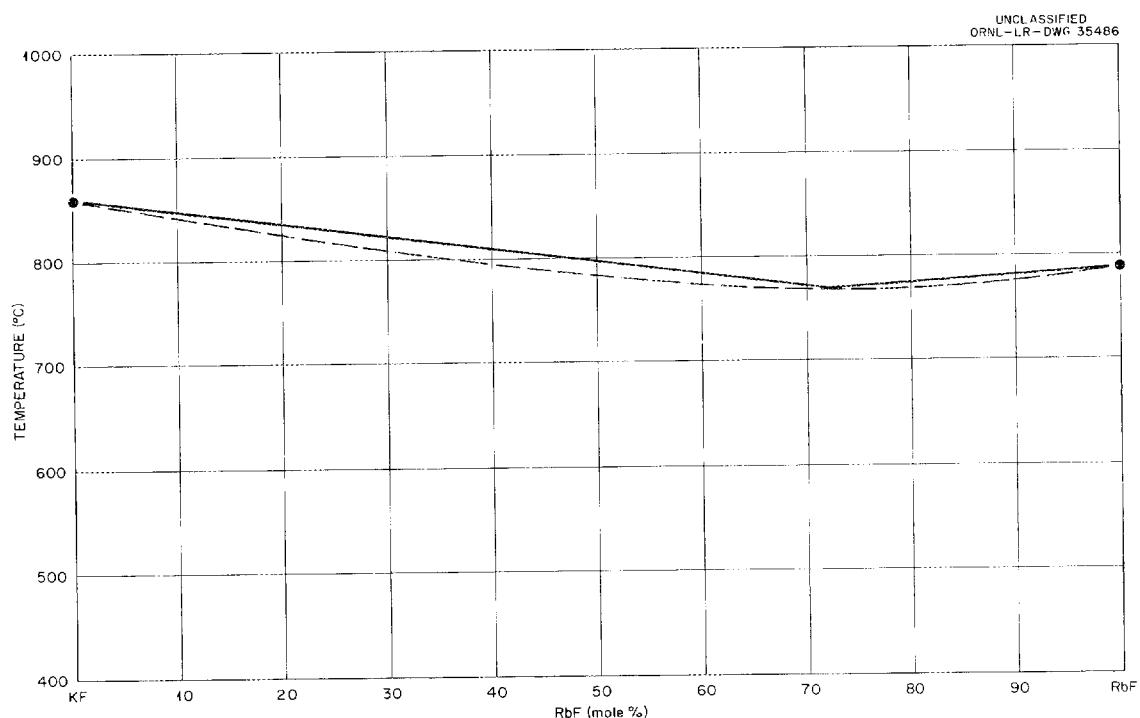

Fig. 3.7. The System KF-RbF.

3.8. The System LiF-NaF-KF

A. G. Bergman and E. P. Dergunov, "Fusion Diagram of LiF-KF-NaF," *Compt. rend. acad. sci. U.R.S.S.* **31**, 753-54 (1941).

The system LiF-NaF-KF contains a single eutectic at 46.5 LiF-11.5 NaF-42.0 KF (mole %), m.p. 454°C.

UNCLASSIFIED
ORNL-LR-DWG 1199A

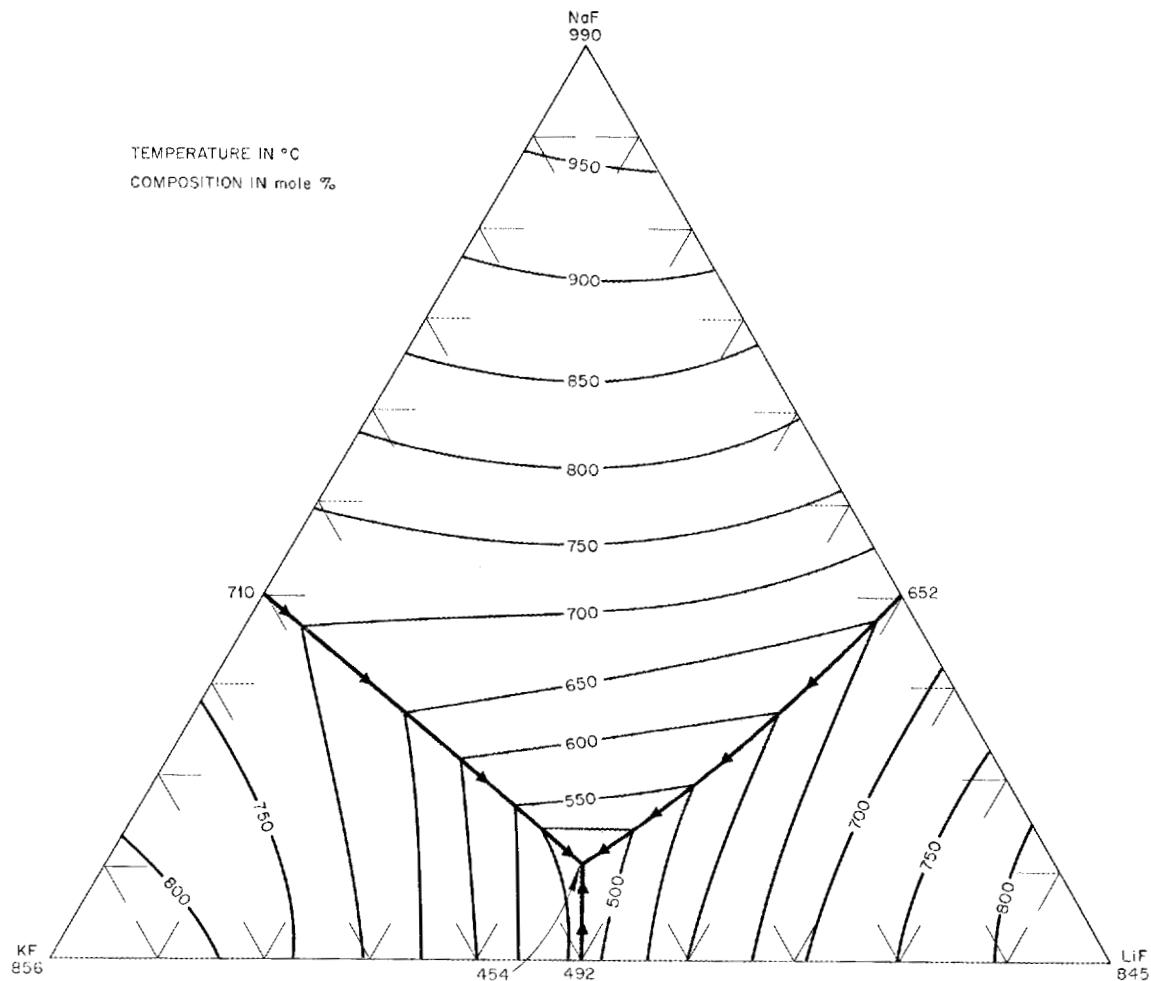

Fig. 3.8. The System LiF-NaF-KF.

3.9. The System LiF-NaF-RbF

C. J. Barton, L. M. Bratcher, J. P. Blakely, and W. R. Grimes, unpublished work performed at the Oak Ridge National Laboratory, 1951.

Preliminary diagram. The system LiF-NaF-RbF contains a single eutectic at 42 LiF-6 NaF-52 RbF (mole %), m.p. $430 \pm 10^\circ\text{C}$. The composition and temperature of the ternary peritectic point have not yet been determined.

General characteristics of the system have been reported by E. P. Dergunov, "Fusion Diagrams of the Ternary systems of the Fluorides of Lithium, Sodium, Potassium, and Rubidium," *Doklady Akad. Nauk S.S.R.* 58, 1369-72 (1947). Dergunov lists the composition and temperature of the ternary eutectic as 46.5 LiF-6.5 NaF-47 RbF (mole %), m.p. 426°C .

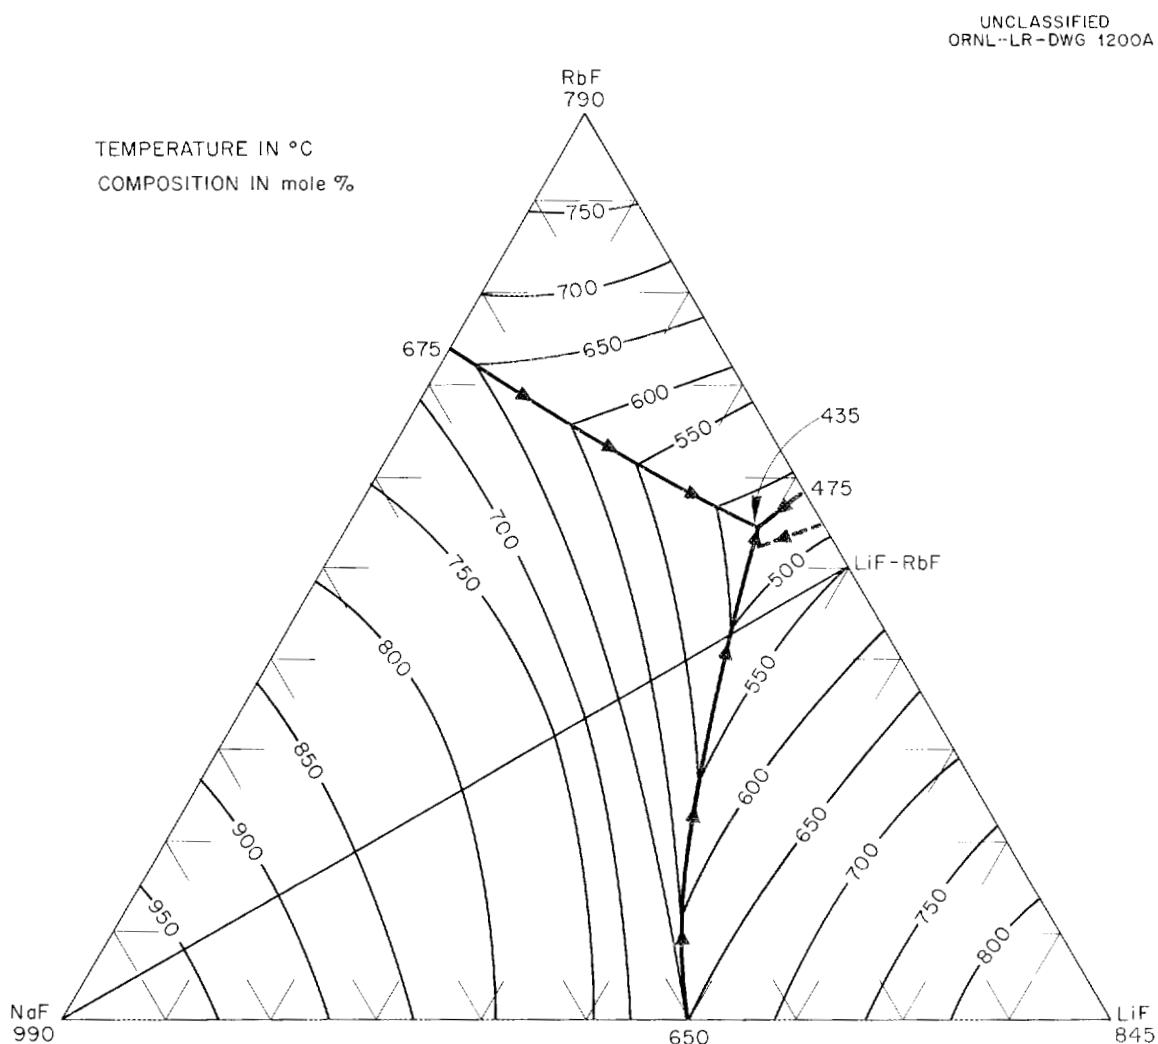

Fig. 3.9. The System LiF-NaF-RbF.

3.10. The System LiF-KF-RbF

C. J. Barton, J. P. Blakely, L. M. Bratcher, and W. R. Grimes, unpublished work performed at the Oak Ridge National Laboratory, 1951.

Preliminary diagram. The system LiF-KF-RbF contains a single eutectic at 40 LiF-32.5 KF-27.5 RbF (mole %), m.p. $440 \pm 10^\circ\text{C}$.

General characteristics of the system have been reported by E. P. Dergunov, "Fusion Diagrams of the Ternary Systems of the Fluorides of Lithium, Sodium, Potassium, and Rubidium," *Doklady Akad. Nauk S.S.R.* 58, 1369-72 (1947).

3.11. The System NaF-KF-RbF

C. J. Barton, L. M. Bratcher, J. P. Blakely, and W. R. Grimes, unpublished work performed at the Oak Ridge National Laboratory, 1951.

Preliminary diagram. The system NaF-KF-RbF contains a single eutectic at 21 NaF-5 KF-74 RbF (mole %), m.p. $621 \pm 10^\circ\text{C}$.

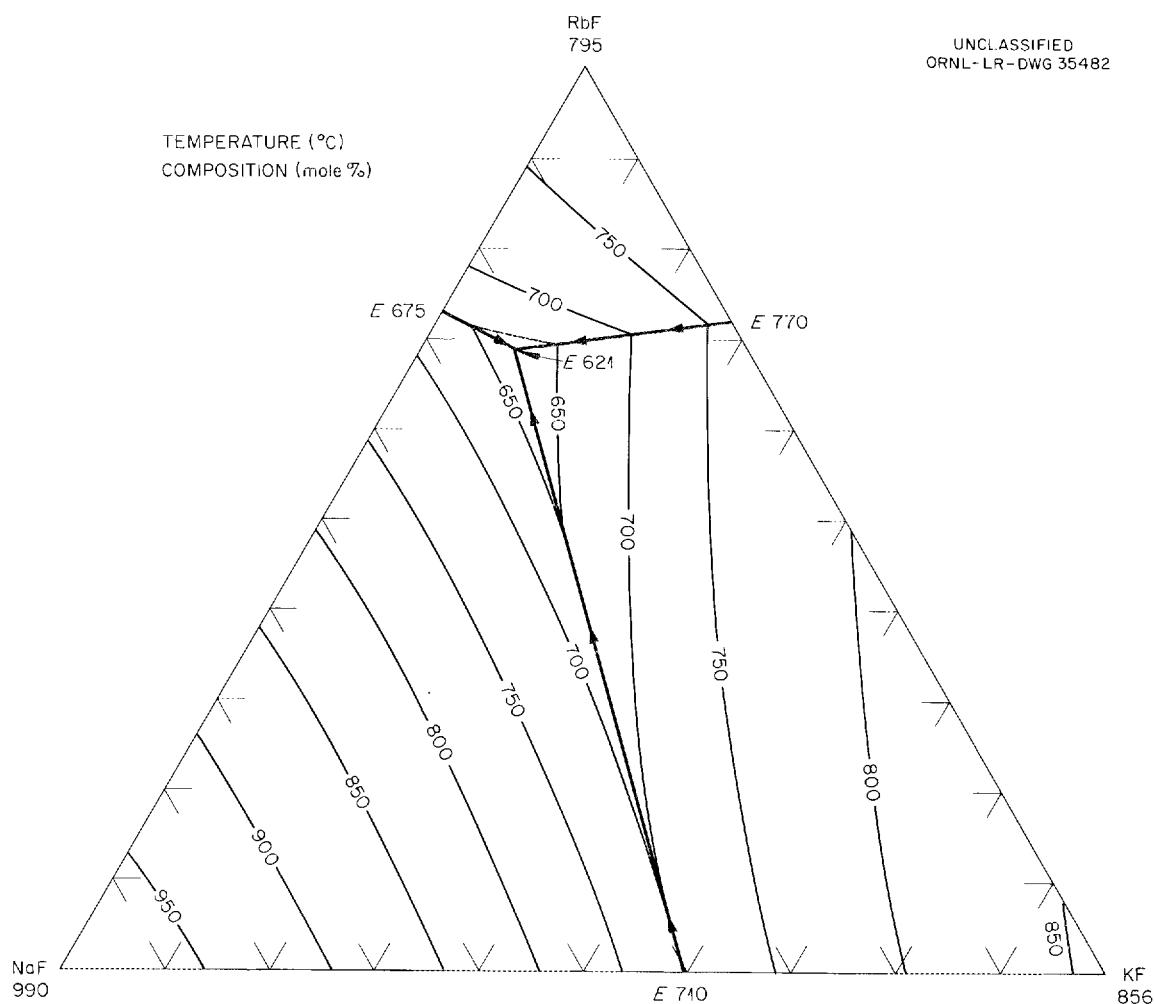

Fig. 3.11. The System NaF-KF-RbF.

3.12. The System NaBF_4 - KBF_4

R. E. Moore, J. G. Surak, and W. R. Grimes, unpublished work performed at the Oak Ridge National Laboratory, 1957.

Preliminary diagram. The system NaBF_4 - KBF_4 contains a single eutectic at 88 NaBF_4 -12 KBF_4 (mole %), m.p. 355°C. The dotted line was obtained from thermal effects representing incompletely understood solid-phase transformations of KBF_4 and NaBF_4 .

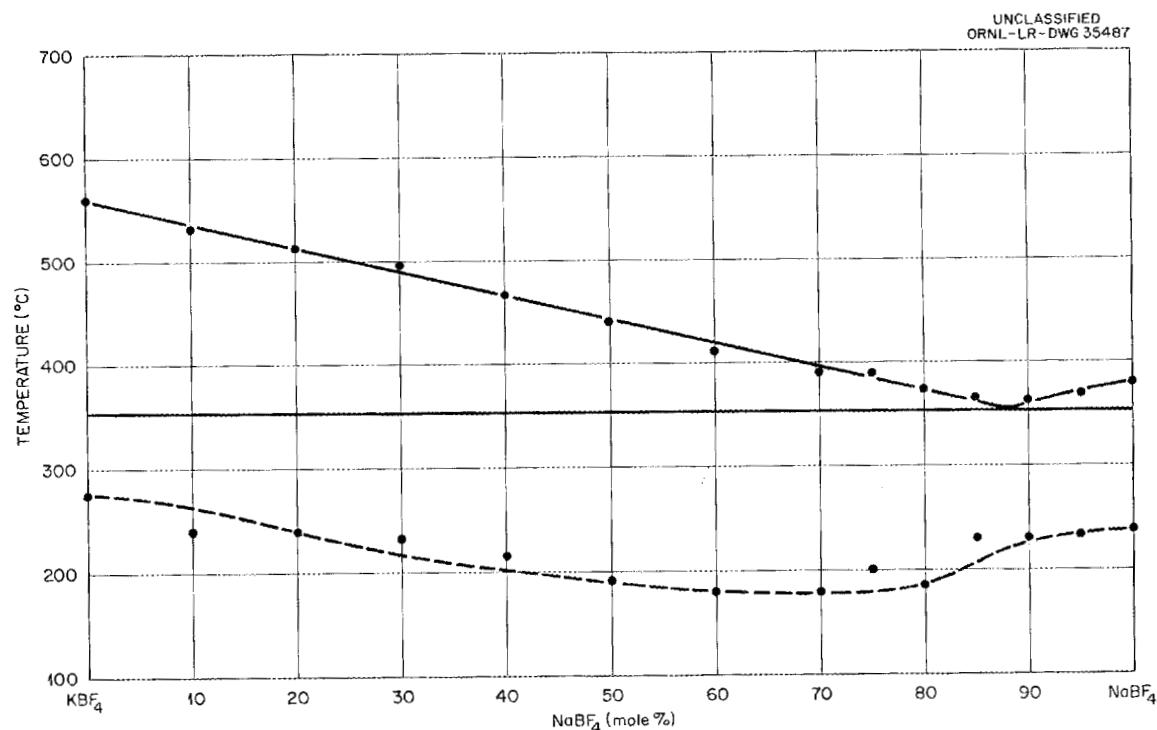

Fig. 3.12. The System NaBF_4 - KBF_4 .

3.13. The System NaF- FeF_2

R. E. Thoma, H. A. Friedman, B. S. Landau, and W. R. Grimes, unpublished work performed at the Oak Ridge National Laboratory, 1957.

Preliminary diagram.

Invariant Equilibria

Mole % FeF_2 in Liquid	Invariant Temperature (°C)	Type of Equilibrium	Phase Reaction at Invariant Temperature
30	680	Eutectic	$L \rightleftharpoons \text{NaF} + \text{NaF}\cdot\text{FeF}_2$
50	783	Congruent melting point	$L \rightleftharpoons \text{NaF}\cdot\text{FeF}_2$
63	745	Eutectic	$L \rightleftharpoons \text{NaF}\cdot\text{FeF}_2 + \text{FeF}_2$

UNCLASSIFIED
ORNL-LR-DWG 17575R

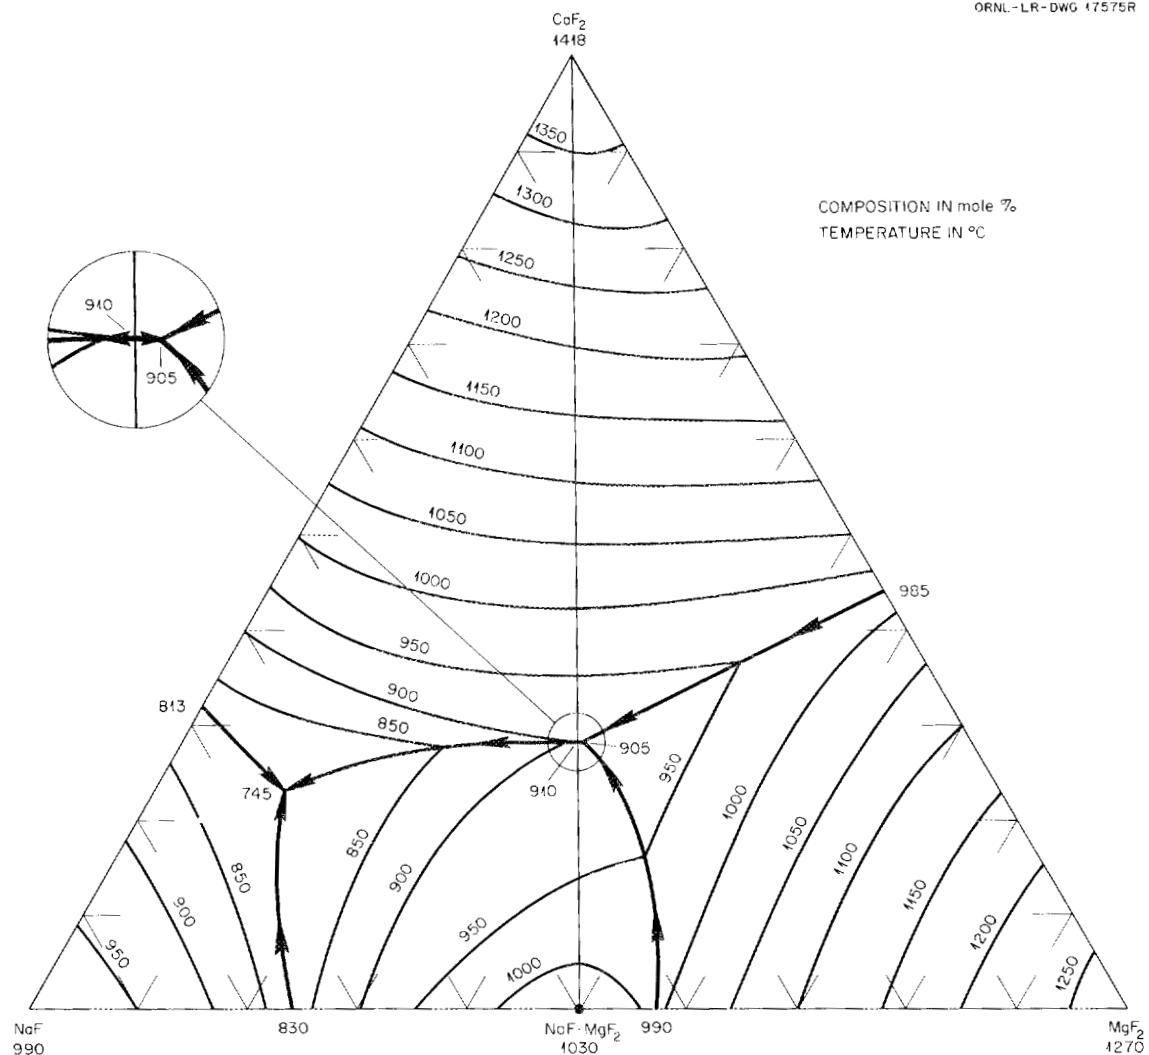

Fig. 3.17a. The System $\text{NaF}-\text{MgF}_2-\text{CaF}_2$

The minimum temperature along the quasi-binary section $\text{NaF}\text{-MgF}_2\text{-CaF}_2$ occurs at the composition 36 NaF-36 MgF₂-28 CaF₂ (mole %), at 910°C.

The existence of the compound $\text{NaF}\text{-MgF}_2$ was previously reported by A. G. Bergman and E. P. Dergunov, *Compt. rend. acad. sci. U.R.S.S.* **31**, 755 (1941).

Ternary systems of alkali fluorides with MgF₂ have been reported by Bergman *et al.* as follows: the system LiF-NaF-MgF₂ by A. G. Bergman and E. P. Dergunov, *Compt. rend. acad. sci. U.R.S.S.* **31**, 755 (1941); the system LiF-KF-MgF₂ by A. G. Bergman and S. P. Parlenko, *Compt. rend. acad. sci. U.R.S.S.* **31**, 818-19 (1941); the system NaF-KF-MgF₂ by A. G. Bergman and E. P. Dergunov, *Compt. rend. acad. sci. U.R.S.S.* **48**, 330 (1945).

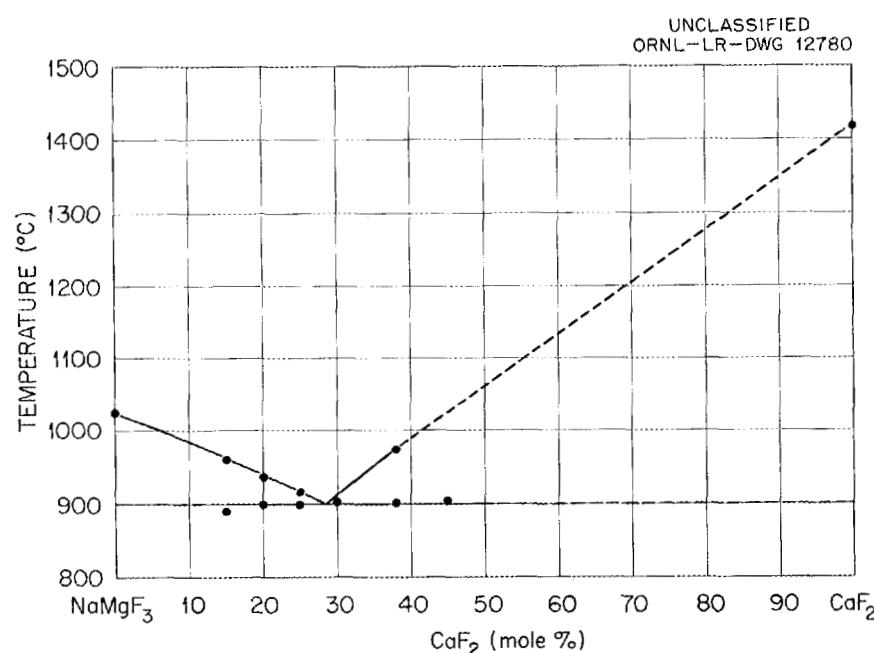

Fig. 3.17b. The Subsystem $\text{NaF}\text{-MgF}_2\text{-CaF}_2$.

3.18. The System $\text{NaF}-\text{KF}-\text{AlF}_3$

C. J. Barton, L. M. Bratcher, and W. R. Grimes, unpublished work performed at the Oak Ridge National Laboratory, 1951-52.

Preliminary diagram. No study has been made at the Oak Ridge National Laboratory of the phase relationships occurring within the system $\text{NaF}-\text{KF}-\text{AlF}_3$. Phase diagrams have been reported for the AlF_3 binary systems, $\text{NaF}-\text{AlF}_3$ [P. P. Fediotieff and W. P. Iljinsky, *Z. anorg. Chem.* **80**, 121 (1913); also N. A. Pushin and A. V. Baskow, *ibid.* **81**, 350 (1913)] and $\text{KF}-\text{AlF}_3$ [P. P. Fediotieff and K. Timofeeff, *Z. anorg. u. allgem. Chem.* **206**, 265 (1932)].

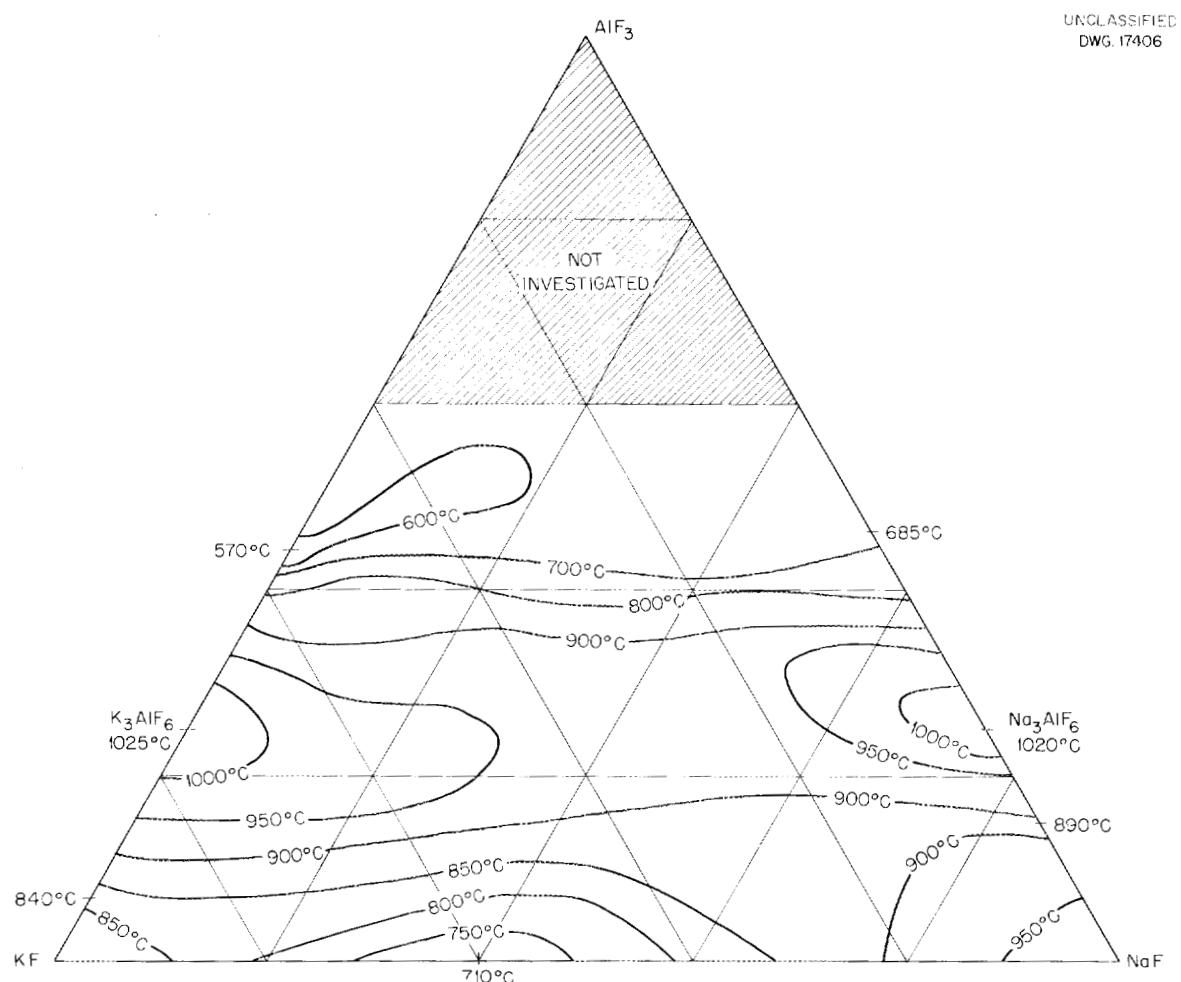

Fig. 3.18. The System $\text{NaF}-\text{KF}-\text{AlF}_3$.

3.19. The System LiF-BeF₂

This phase diagram is a composite from several published sources¹⁻³ and from unpublished data derived at the Oak Ridge National Laboratory (R. E. Moore, C. J. Barton, R. E. Thoma, and T. N. McVay) and at the Mound Laboratory (J. F. Eichelberger, C. R. Hudgens, L. V. Jones, and T. B. Rhinehammer). Thermal gradient quenching data (ORNL) and differential thermal analysis data (Mound Laboratory) have served to corroborate this composite diagram.

Invariant Equilibria

Mole % BeF ₂ in Liquid	Invariant Temperature (°C)	Type of Equilibrium	Phase Reaction at Invariant Temperature
33.5*	454	Peritectic	$L + LiF \rightleftharpoons 2LiF \cdot BeF_2$
52	355	Eutectic	$L \rightleftharpoons 2LiF \cdot BeF_2 + BeF_2$
-	280	Upper temperature of stability for LiF-BeF ₂	$2LiF \cdot BeF_2 + BeF_2 \rightleftharpoons LiF \cdot BeF_2$

*Ref 3.

Roy, Roy, and Osborn have reported the presence of the compound LiF·2BeF₂ in the system LiF-BeF₂ although neither the Mound Laboratory nor the ORNL data have indicated the existence of this compound.

53	42	4	510	Peritectic	$\text{NaF}\cdot2\text{ThF}_4$, $\text{Th}(\text{Zr})\text{F}_4^{ss}$, and $7\text{NaF}\cdot6\text{ZrF}_4 - 3\text{NaF}\cdot2\text{ThF}_4^{ss}$
49.5	48	2.5	505	Eutectic	$7\text{NaF}\cdot6\text{ZrF}_4$, $3\text{NaF}\cdot4\text{ZrF}_4$, and $\text{Zr}(\text{Th})\text{F}_4^{ss}$

*Approximate composition.

Note: The boundary curve maximum on the Alkemade line $7\text{NaF}\cdot6\text{ZrF}_4-\text{ThF}_4$ is unlikely to fall exactly on this line, because pure ThF_4 does not occur along this line. Since ThF_4 forms solid solutions with both ZrF_4 and $\text{NaF}\cdot2\text{ThF}_4$, it is not readily determined on which side of the Alkemade line this maximum occurs.

5. AQUEOUS SYSTEMS

5.1. The System $\text{UO}_2\text{-P}_2\text{O}_5\text{-H}_2\text{O}$, 25°C Isotherm

J. M. Schreyer, "The Solubility of Uranium(IV) Orthophosphates in Phosphoric Acid Solutions," *J. Am. Chem. Soc.* **77**, 2972 (1955).

The transition point between $\text{U}(\text{HPO}_4)_2 \cdot 6\text{H}_2\text{O}$ and $\text{U}(\text{HPO}_4)_2 \cdot \text{H}_3\text{PO}_4 \cdot \text{H}_2\text{O}$ as stable solids was at $0.62 \pm 0.02 \text{ M U}$ (10.3 wt % UO_2) and $9.8 \pm 0.1 \text{ M PO}_4$ (42.6 wt % P_2O_5), density $1.63 \pm 0.03 \text{ g/ml}$. The compound $\text{U}(\text{HPO}_4)_2 \cdot \text{H}_3\text{PO}_4 \cdot \text{H}_2\text{O}$ is incongruently soluble in water.

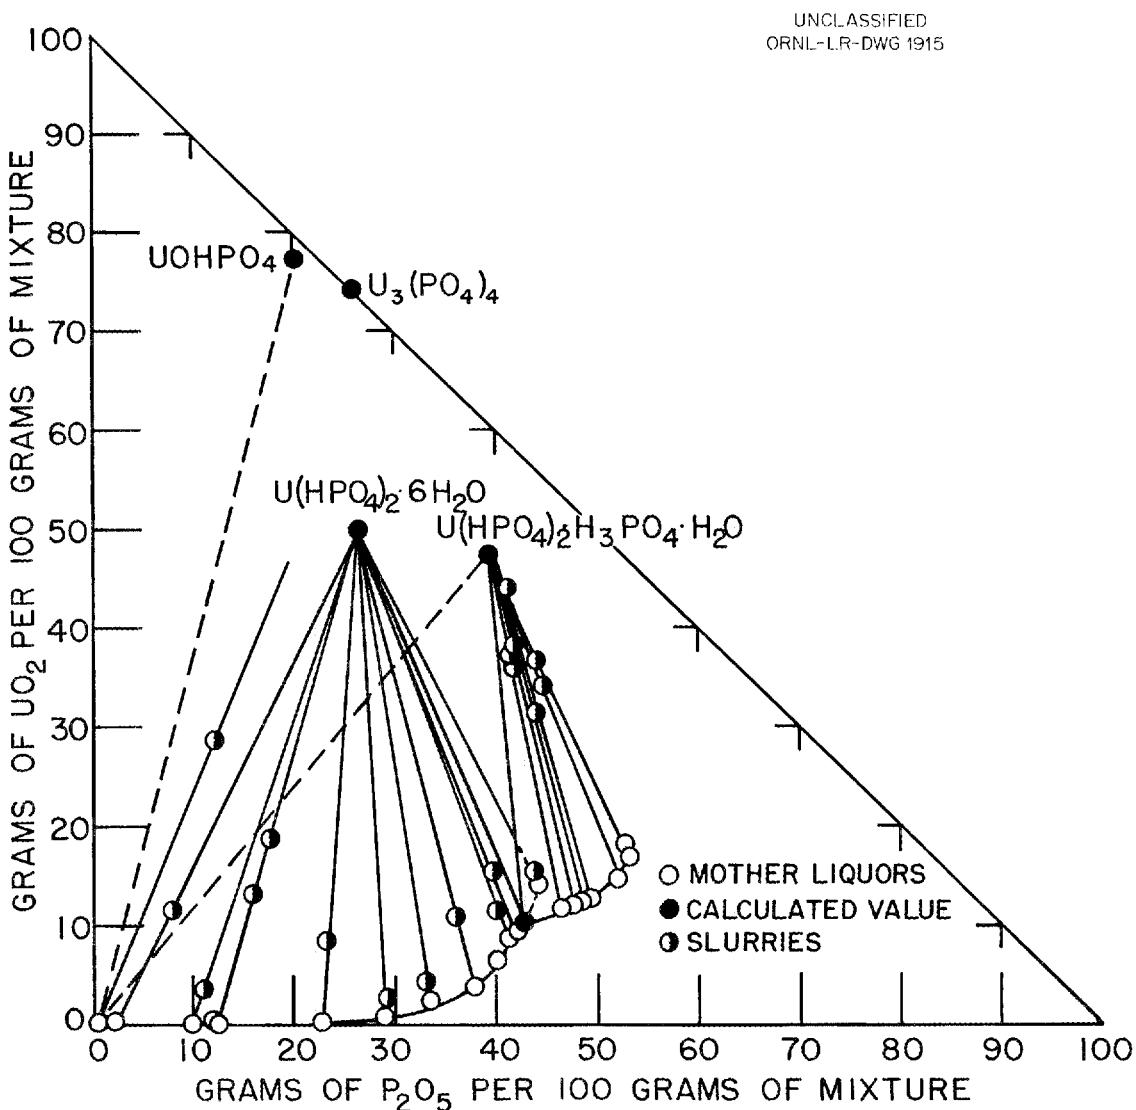

Fig. 5.1. The System $\text{UO}_2\text{-P}_2\text{O}_5\text{-H}_2\text{O}$, 25°C Isotherm.

5.2. The System $\text{UO}_3\text{-H}_3\text{PO}_4\text{-H}_2\text{O}$, 25°C Isotherm

J. M. Schreyer and C. F. Baes, Jr., "The Solubility of Uranium(VI) Orthophosphates in Phosphoric Acid Solution," *J. Am. Chem. Soc.* **76**, 354 (1954).

The normal phosphate $(\text{UO}_2)_3(\text{PO}_4)_2 \cdot 6\text{H}_2\text{O}$ is stable below 0.025 mole % H_3PO_4 . The stability ranges are as follows:

Compound	Total Phosphate Molarity
$(\text{UO}_2)_3(\text{PO}_4)_2 \cdot 6\text{H}_2\text{O}$	<0.014
$\text{UO}_2\text{HPO}_4 \cdot 4\text{H}_2\text{O}$	0.014-6.1
$\text{UO}_2(\text{H}_2\text{PO}_4)_2 \cdot 3\text{H}_2\text{O}$	>6.1

UNCLASSIFIED
DWG 20233

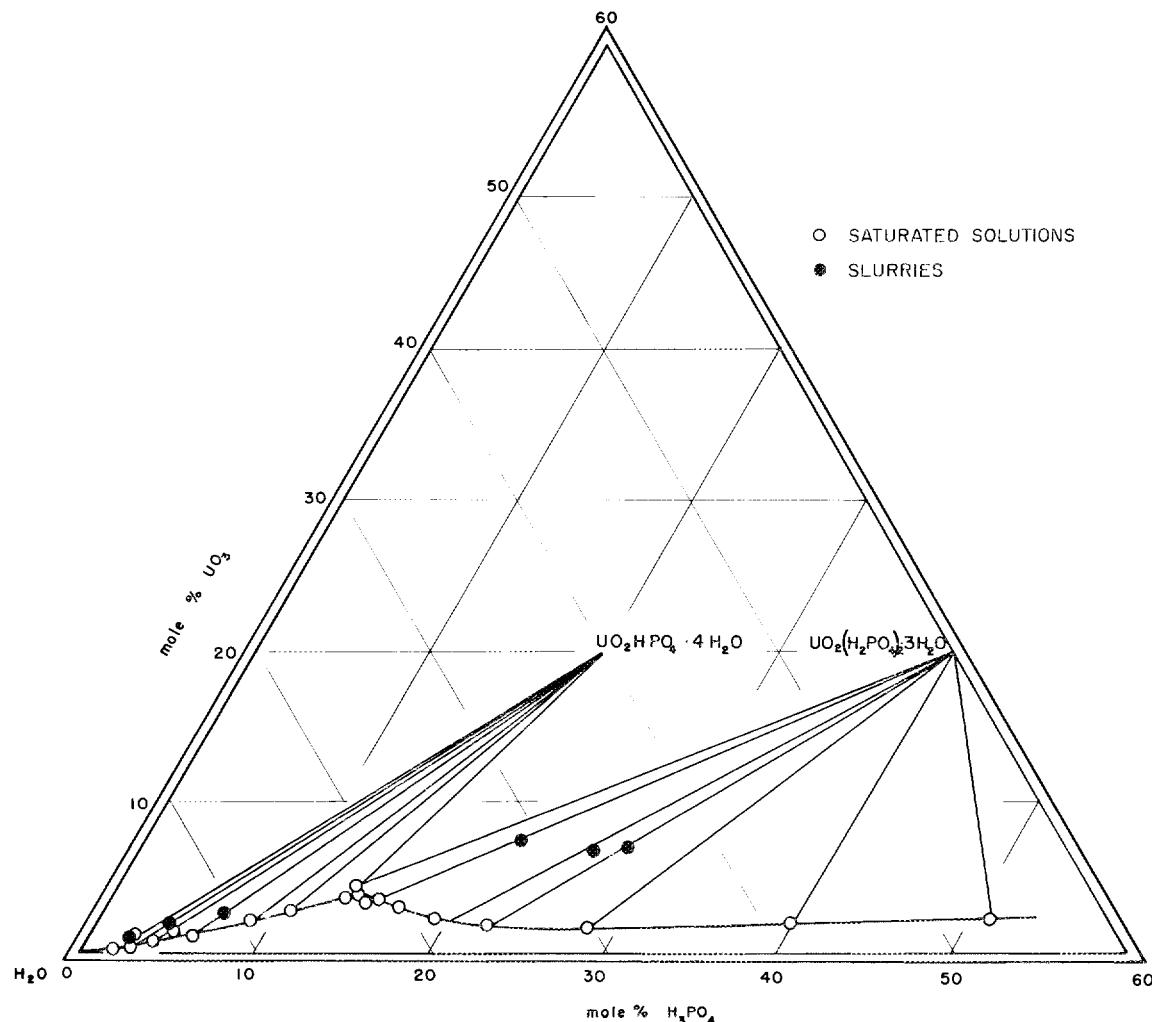

Fig. 5.2. The System $\text{UO}_3\text{-H}_3\text{PO}_4\text{-H}_2\text{O}$, 25°C Isotherm. 0-60 mole % UO_3 , 0-60 mole % H_3PO_4 .

5.3. The System $\text{U}(\text{HPO}_4)_2\text{-Cl}_2\text{O}_7\text{-H}_2\text{O}$, 25°C Isotherm

J. M. Schreyer and L. R. Phillips, "The Solubility of Uranium(VI) Orthophosphates in Perchloric Acid Solutions," *J. Phys. Chem.* **60**, 588 (1956).

The stable solids in this system are $\text{U}(\text{HPO}_4)_2 \cdot 2\text{H}_2\text{O}$, $\text{U}(\text{H}_2\text{PO}_4)_2(\text{ClO}_4)_2 \cdot 4\text{H}_2\text{O}$, and $\text{U}(\text{H}_2\text{PO}_4)_2(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O}$. Metastable anhydrous $\text{U}(\text{HPO}_4)_2$ formed readily in all solution compositions tested. X-ray diffraction patterns indicated the existence of three polymorphic forms of $\text{U}(\text{H}_2\text{PO}_4)_2(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O}$.

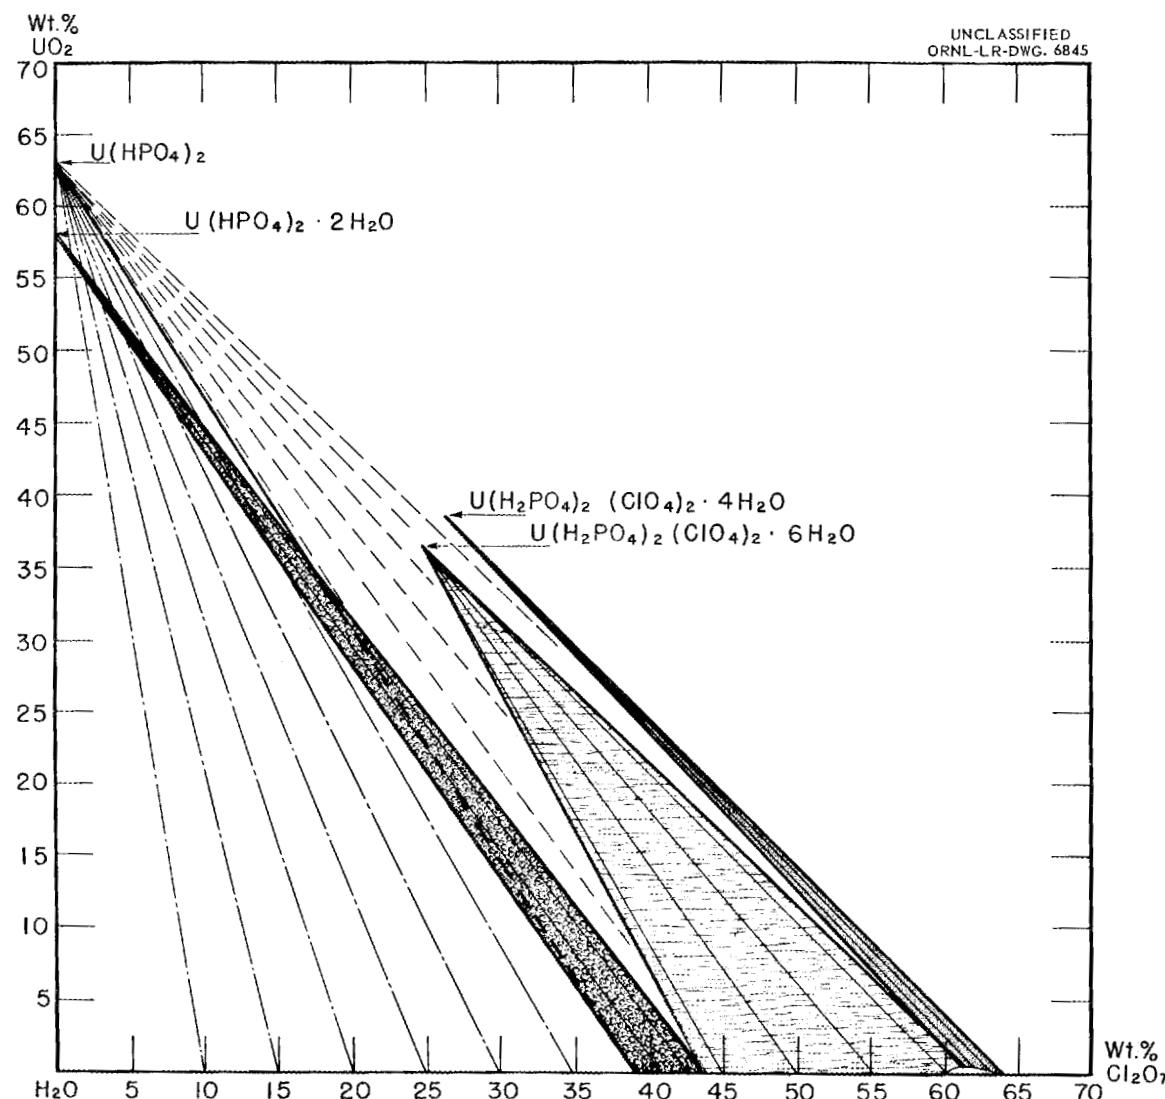

Fig. 5.3. Schreinemakers' Projection of the System $\text{UO}_2\text{-P}_2\text{O}_5\text{-Cl}_2\text{O}_7\text{-H}_2\text{O}$ at 25°C. A projection on the $\text{UO}_2\text{-Cl}_2\text{O}_7\text{-H}_2\text{O}$ face, plotted in rectangular coordinates.

5.4. The System $\text{UO}_3\text{-Na}_2\text{O}\text{-CO}_2\text{-H}_2\text{O}$, 26°C Isotherm

C. A. Blake, C. F. Coleman, K. B. Brown, D. G. Hill, R. S. Lowrie, and J. M. Schmitt,
 "Studies in the Carbonate-Uranium System," *J. Am. Chem. Soc.* **78**, 5978 (1956).

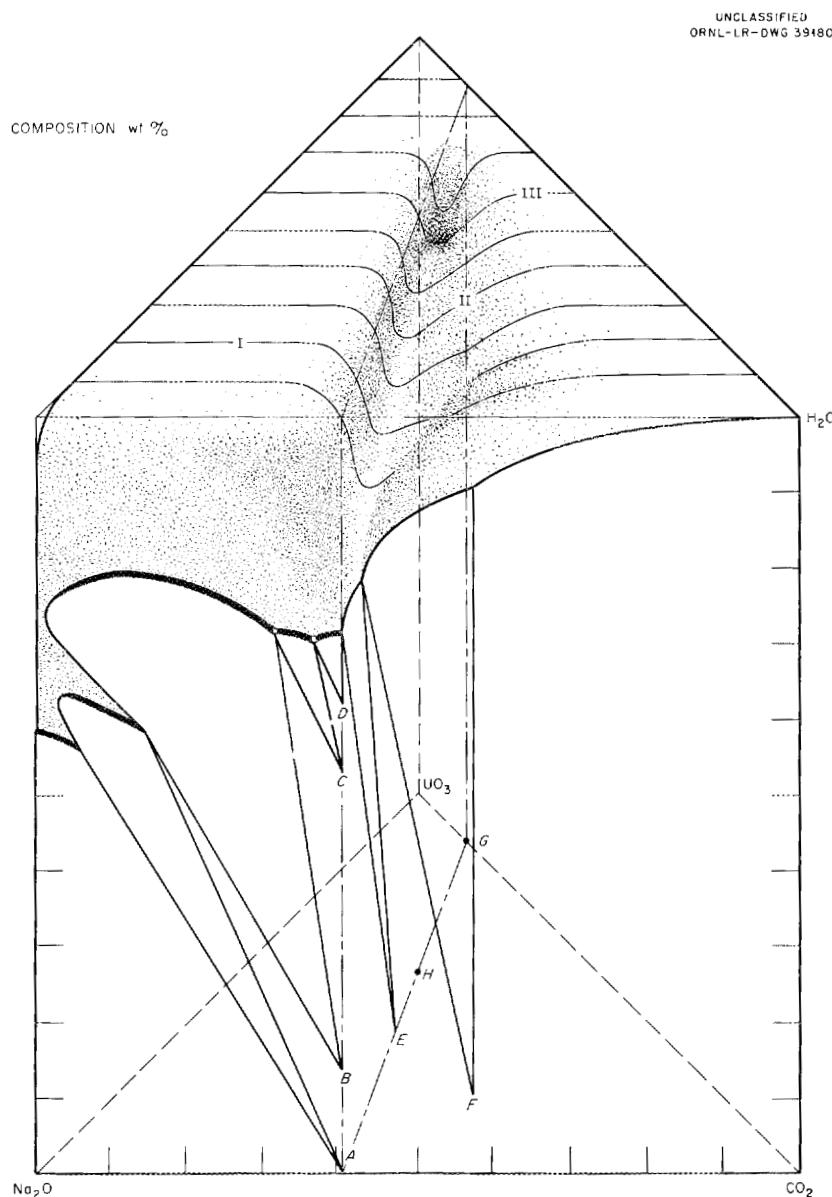

Fig. 5.4a. The System $\text{UO}_3\text{-Na}_2\text{O}\text{-CO}_2\text{-H}_2\text{O}$ at 26°C. Compositions are plotted in weight per cent. I, solutions in equilibrium with sodium uranates; II, solutions in equilibrium with sodium uranyl tricarbonate; III, solutions in equilibrium with uranyl carbonate. A, Na_2CO_3 ; B, $\text{Na}_2\text{CO}_3\cdot\text{H}_2\text{O}$; C, $\text{Na}_2\text{CO}_3\cdot 7\text{H}_2\text{O}$; D, $\text{Na}_2\text{CO}_3\cdot 10\text{H}_2\text{O}$; E, $\text{Na}_2\text{CO}_3\cdot\text{NaHCO}_3\cdot 2\text{H}_2\text{O}$ (trona); F, NaHCO_3 ; G, UO_2CO_3 ; H, $\text{Na}_4\text{UO}_2(\text{CO}_3)_3$. The entire upper face of the triangular prism represents pure water.

The stable uranium-carbonate solids found were UO_2CO_3 and $\text{Na}_4\text{UO}_2(\text{CO}_3)_3$. The solution composition at the transition point (not determined exactly) was at least 26 wt % UO_3 , 5.6 wt % Na_2O , and 7.2 wt % CO_2 (mole ratio $\text{UO}_3:\text{Na}_2\text{O}:\text{CO}_2 = 1:1.0:1.8$).

Further data on this system are available from the American Documentation Institute (document No. 5079). These include compositions, pH's, and densities at points in and near the planes $\text{Na}_2\text{O}-\text{CO}_2-\text{H}_2\text{O}$, $\text{UO}_3-\text{Na}_2\text{O}-\text{H}_2\text{O}$, $\text{UO}_2\text{CO}_3-\text{Na}_2\text{CO}_3-\text{H}_2\text{O}$, $\text{Na}_4\text{UO}_2(\text{CO}_3)_3-\text{NaHCO}_3-\text{H}_2\text{O}$, $\text{UO}_3-\text{Na}_2\text{CO}_3-\text{H}_2\text{O}$, $\text{UO}_3-\text{NaHCO}_3-\text{H}_2\text{O}$, and $\text{UO}_2\text{CO}_3-\text{Na}_2\text{O}-\text{H}_2\text{O}$.

Related phase equilibria in the system $\text{Na}_2\text{O}-\text{UO}_3-\text{H}_2\text{O}$ at 50 and 75°C are reported by J. E. Ricci and F. J. Loprest, *J. Am. Chem. Soc.* 77, 2119 (1955).

F. A. Schimmel, unpublished work performed at the Oak Ridge National Laboratory, 1955.
The stable thorium-carbonate solids found were $\text{ThOOCO}_3\cdot 8\text{H}_2\text{O}$ and $\text{Na}_6\text{Th}(\text{CO}_3)_5\cdot 12\text{H}_2\text{O}$.

Ternary Points

Solid Phases Present	Composition of Solution (wt %)		
	ThO_2	Na_2O	CO_2
$\text{Na}_6\text{Th}(\text{CO}_3)_5\cdot 12\text{H}_2\text{O}$, NaHCO_3 , and $\text{Na}_2\text{CO}_3\cdot \text{NaHCO}_3\cdot 2\text{H}_2\text{O}$ (trona)	0.62	12.0	9.96
$\text{Na}_6\text{Th}(\text{CO}_3)_5\cdot 12\text{H}_2\text{O}$, $\text{Na}_2\text{CO}_3\cdot 10\text{H}_2\text{O}$, and trona	0.48	14.1	10.86

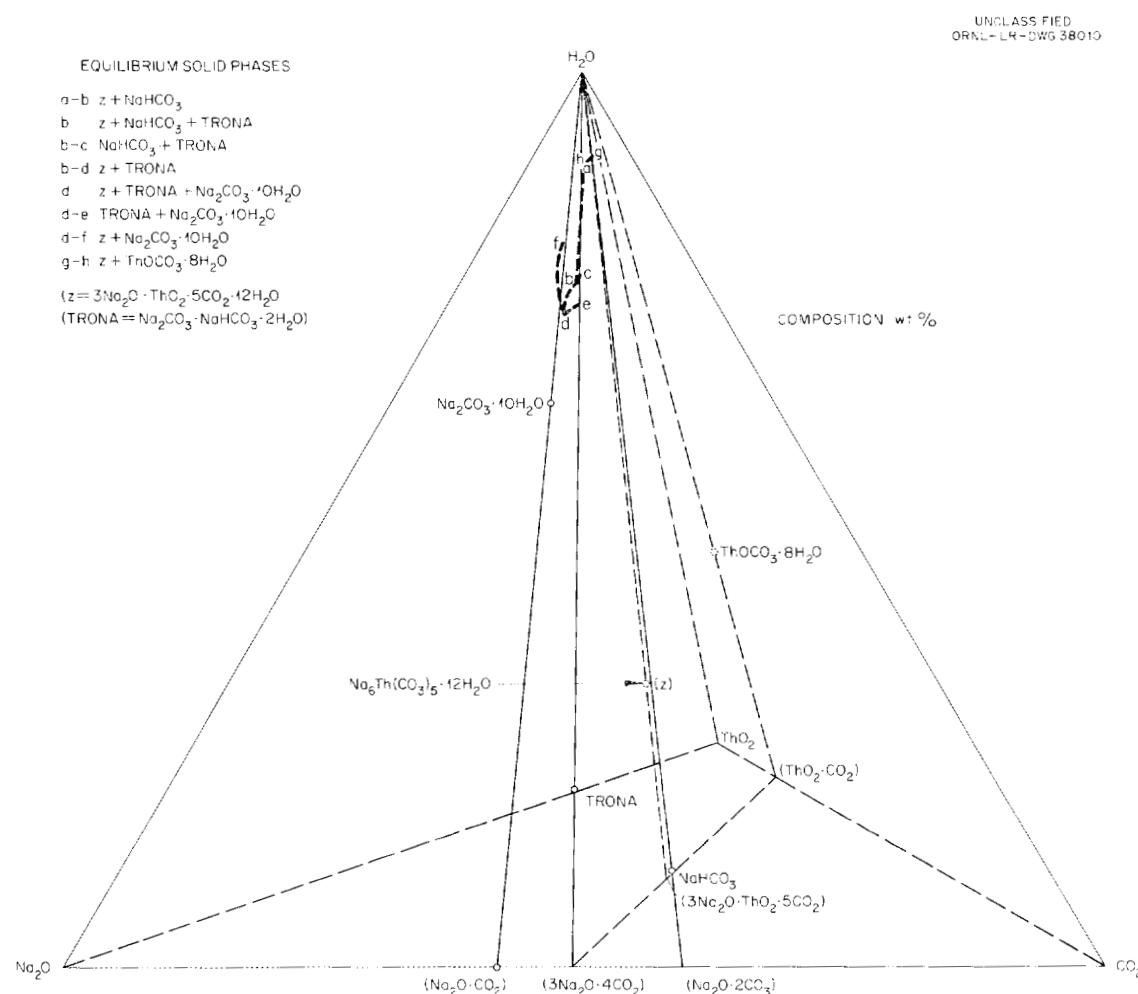

Fig. 5.5a. Perspective Representation of the System $\text{ThO}_2\text{-Na}_2\text{O}\text{-CO}_2\text{-H}_2\text{O}$ as a Tetrahedron.

The highest thorium solubility found was 3.35 wt % ThO_2 (3.06 wt % Na_2O , 3.60 wt % CO_2) in equilibrium with solid $\text{Na}_6\text{Th}(\text{CO}_3)_5 \cdot 12\text{H}_2\text{O}$ and $\text{ThOOCO}_3 \cdot 8\text{H}_2\text{O}$. (The terminal points of this binary line were not established.) The maximum thorium solubility in equilibrium with $\text{Na}_6\text{Th}(\text{CO}_3)_5 \cdot 12\text{H}_2\text{O}$ and $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ was 1.25 wt % ThO_2 (12.5 wt % Na_2O , 9.4 wt % CO_2); with $\text{Na}_6\text{Th}(\text{CO}_3)_5 \cdot 12\text{H}_2\text{O}$ and trona, the highest solubility was 0.7 wt % ThO_2 (12.6 wt % Na_2O , 10.4 wt % CO_2). The highest found with $\text{Na}_6\text{Th}(\text{CO}_3)_5 \cdot 12\text{H}_2\text{O}$ and NaHCO_3 was 1.2 wt % ThO_2 (5.0 wt % Na_2O , 6.0 wt % CO_2), which was the most dilute NaHCO_3 solution tested.

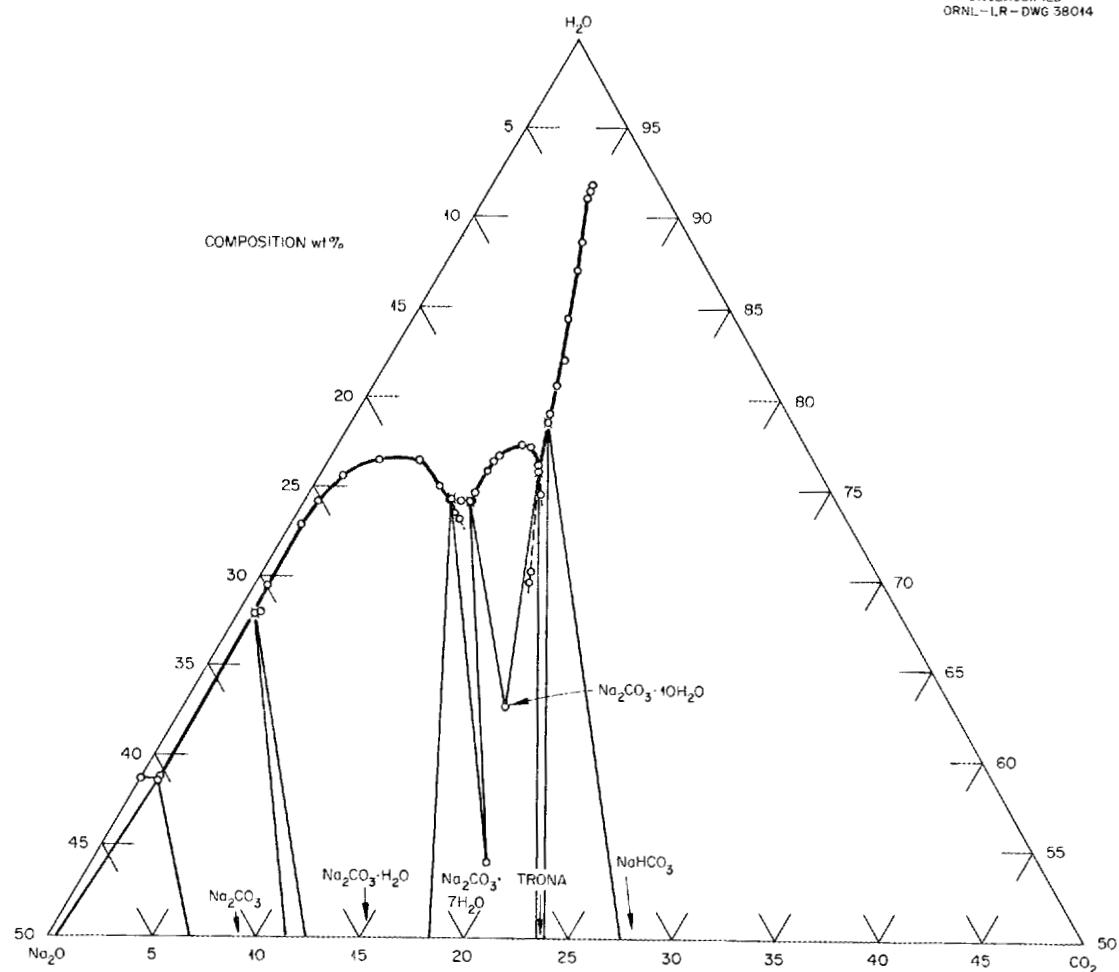

Fig. 5.6. The System $\text{Na}_2\text{O}-\text{CO}_2-\text{H}_2\text{O}$, 25°C Isotherm. 0–50 wt % Na_2O , 0–50 wt % CO_2 .

5.7. Solubility of Uranyl Sulfate in Water

1. C. H. Secoy, *J. Am. Chem. Soc.* **72**, 3343 (1950) (data above 300°C).
2. C. H. Secoy, *J. Am. Chem. Soc.* **70**, 3450 (1948) (data up to 300°C).
3. L. Helmholtz and G. Friedlander, *Physical Properties of Uranyl Sulfate Solutions*, MDDC-808 (1943) (room temperature data).
4. C. Dittrich, *Z. physik. Chem.* **29**, 449 (1899).
5. E. V. Jones and W. L. Marshall, *HRP Quar. Prog. Rep. March 15, 1952*, ORNL-1280, p 180-83.
6. E. V. Jones and W. L. Marshall, *HRP Quar. Prog. Rep. Jan. 31, 1959*, ORNL-2696, p 210-11.

The two-liquid-phase region of this system in actuality must be represented by the three components UO_3 , SO_3 , and H_2O . The curve representing the boundary of liquid-liquid immiscibility is correct for stoichiometric solutions. However, the tie lines within the region of immiscibility do not connect two solutions containing stoichiometric UO_2SO_4 but rather connect solutions containing varying concentrations and ratios of UO_3 and SO_3 (Fig. 5.10). At low concentrations and high temperatures, that is, below 0.02 m UO_2SO_4 and above 250°C, hydrolysis occurs to produce a nonstoichiometric solution phase. The point of hydrolysis is dependent on concentration and temperature (see Sec 5.13).

Note: Revised data (ref 5) are used to construct the immiscibility boundary in the figure. Earlier data (ref 1) showed higher temperatures in this region and a possible likelihood of acid impurity in the solutions.

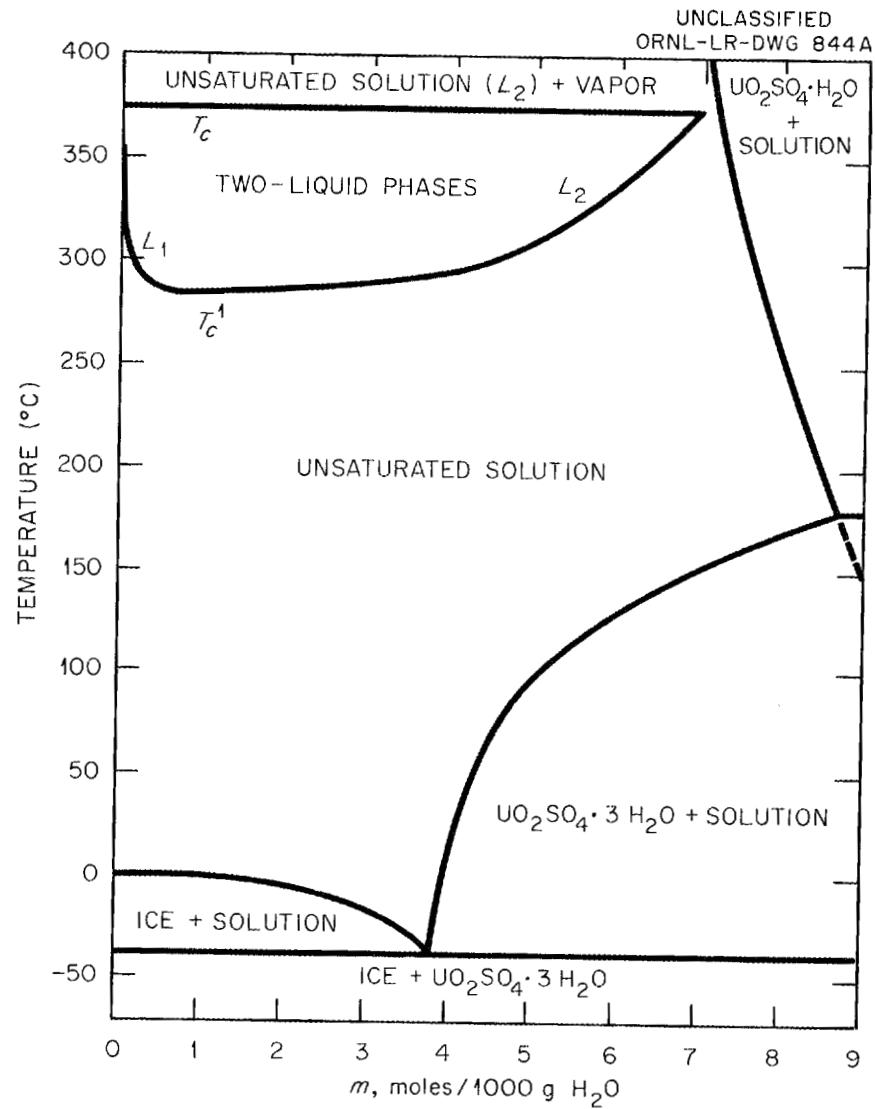

Fig. 5.7. The System $\text{UO}_2\text{SO}_4 \cdot \text{H}_2\text{O}$.

5.8. Two-Liquid-Phase Region of UO_2SO_4 in Ordinary and Heavy Water

E. V. Jones and W. L. Marshall, *HRP Quar. Prog. Rep.* March 15, 1952, ORNL-1280, p 180-83.

The two curves shown are boundary curves for liquid-liquid immiscibility obtained by observing the phase-transitional behavior of known $\text{UO}_2\text{SO}_4-\text{H}_2\text{O}$ (D_2O) solutions in sealed tubes as a function of temperature. For later reference, this procedure is designated the visual-synthetic method. As was described in Sec 5.7, the concentrations and compositions of the two phases within the boundary region at equilibrium cannot be obtained from this figure. Mixtures which are solutions at lower temperatures separate into two liquid phases as the temperature is raised, according to the boundary curves.

5.9. The System $\text{UO}_3\text{-SO}_3\text{-H}_2\text{O}$

1. A. Colani, *Bull. soc. chim. France* [4] 43, 754-62 (1928).
2. J. S. Gill, E. V. Jones, and C. H. Secoy, *HRP Quar. Prog. Rep.* Oct. 31, 1953, ORNL-1658, p 87.

The 25° data on the SO_3 -rich side are those of Colani. The higher temperature data are those of Gill, Jones, and Secoy, obtained by filtration techniques at temperature. The number and identity of the solid phases in the UO_3 -rich regions at 25, 100, and 175°C are somewhat uncertain. Subsequent unpublished work of F. E. Clark and C. H. Secoy has disclosed that the K solid is identical (x-ray diffraction) with the mineral uranopilite, $6\text{UO}_3\cdot\text{SO}_3\cdot x\text{H}_2\text{O}$, that the G solid is not identifiable as any known mineral, and that at least one additional unidentified solid phase occurs at 25 and 100°. The liquidus curves for the 25 and 100° isotherms are essentially correct as shown except that the transition points (two solid phases) occur at somewhat lower concentrations than those indicated.

5.10. Coexistence Curves for Two Liquid Phases in the System $\text{UO}_2\text{SO}_4-\text{H}_2\text{SO}_4-\text{H}_2\text{O}$

H. W. Wright, W. L. Marshall, and C. H. Secoy, *HRP Quar. Prog. Rep.* Oct. 1, 1952, ORNL-1424, p 108.

All curves in this figure must extrapolate to the critical temperature of water (374.2°C) at zero concentration of uranium. These are boundary curves which were determined by observing sealed tubes in which immiscibility occurred in $\text{UO}_3-\text{SO}_3-\text{H}_2\text{O}$ solutions upon varying the temperature. As was explained in Sec 5.7, they do not represent concentrations and compositions of the two liquid phases within the temperature-concentration region of immiscibility but are lower solution boundary curves.

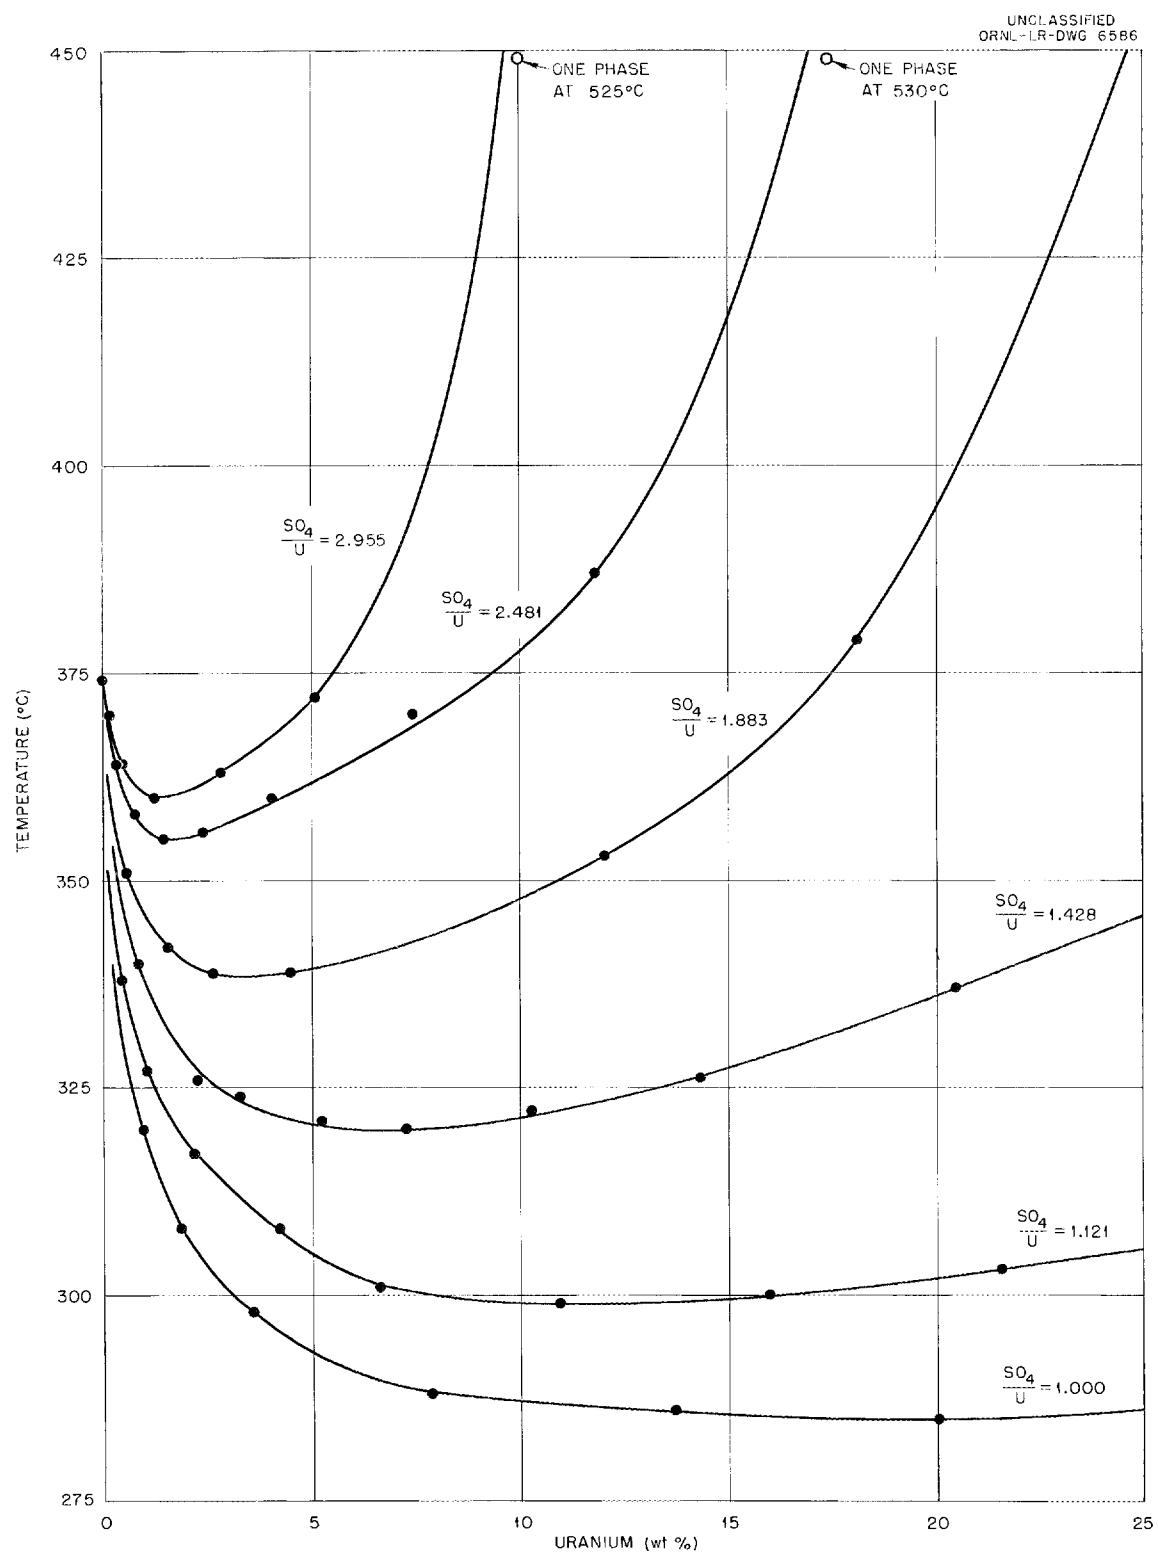

Fig. 5.10. Coexistence Curves for Two Liquid Phases in the System $UO_2SO_4-H_2SO_4-H_2O$.

5.11. Two-Liquid-Phase Region of the System $\text{UO}_2\text{SO}_4-\text{H}_2\text{SO}_4-\text{H}_2\text{O}$

R. E. Leed and C. H. Secoy, *Chem. Quar. Prog. Rep.* Sept. 30, 1950, ORNL-870, p 29-30; C. H. Secoy, *Chem. Quar. Prog. Rep.* Dec. 31, 1949, ORNL-607, p 33-38.

In contrast with the immiscibility curves shown in Fig. 5.10, each of these curves must extrapolate to a critical temperature curve for $\text{SO}_3-\text{H}_2\text{O}$ in which a small or negligible amount of UO_3 is dissolved. Since SO_3 dissolved in H_2O (neglecting any dissolved UO_3) will elevate the critical temperature, the curves obtained from solutions containing a constant amount of free H_2SO_4 will all extrapolate to critical temperatures higher than that (374.2°C) for H_2O alone.

5.19. Phase-Transition Temperatures in Solutions Containing CuSO_4 , UO_2SO_4 , and H_2SO_4

E. E. Clark, J. S. Gill, R. Slusher, and C. H. Secoy, *J. Chem. Eng. Data* 4, 12 (1959).

All data were obtained by the visual-synthetic method mentioned in Sec 5.8 and represent temperatures at which immiscibility occurred upon raising the temperature. No deductions can be made regarding compositions within the two-liquid-phase region.

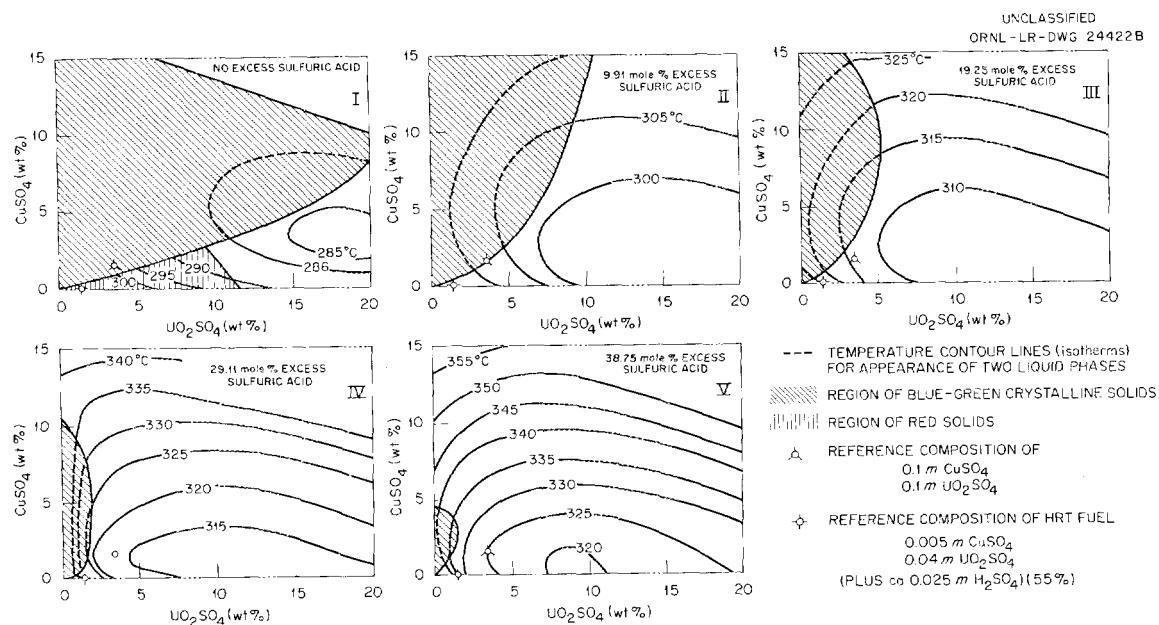

Fig. 5.19. Phase-Transition Temperatures in Solutions Containing CuSO_4 , UO_2SO_4 , and H_2SO_4 .

5.20. The Effect of CuSO_4 and NiSO_4 on Phase-Transition Temperatures: 0.04 m UO_2SO_4 ; 0.01 m H_2SO_4

C. H. Secoy et al., HRP Quar. Prog. Rep. July 31, 1957, ORNL-2379, p 163. Also additional data: F. Moseley, Core Solution Stability in the Homogeneous Aqueous Reactor; the Effect of Corrosion Product and Copper Concentrations, HARD(C)/P-41 (May 1957).

The curves for liquid-liquid immiscibility were drawn from data obtained by the visual-synthetic method mentioned in Sec 5.8. Saturation temperatures for solid-liquid equilibria were obtained by measuring solution concentrations as a function of temperature and determining a break in the curve. The numbers in parentheses are temperatures at which the indicated solid phase appeared upon raising the temperature. Solid phases indicated in parentheses were found in small quantity.

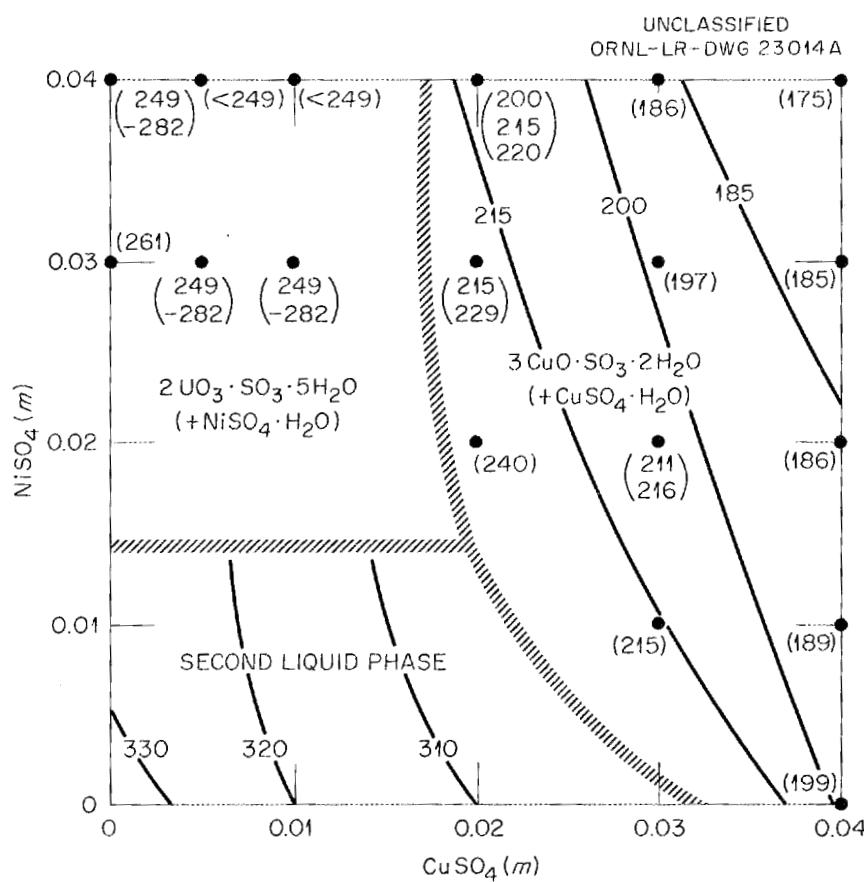

Fig. 5.20. The Effect of CuSO_4 and NiSO_4 on Phase-Transition Temperatures: 0.04 m UO_2SO_4 ; 0.01 m H_2SO_4 .

5.21. The System $\text{UO}_3\text{-CuO-NiO-SO}_3\text{-D}_2\text{O}$ at 300°C ; 0.06 m SO_3

J. S. Gill, R. Slusher, and W. L. Marshall, *HRP Quar. Prog. Rep. Jan. 31, 1959*, ORNL-2696, p 205-13.

The variation in solution composition in the presence of one, two, and three solid phases was determined at 300°C from 0.04 to 0.2 m SO_3 . Solubility relationships at 0.06 m SO_3 were obtained from these separate solubility curves, and the skeletal volume figure for the five-component system was drawn. Other skeletal figures can be drawn at various SO_3 concentrations. This investigation is still in progress, and the data are subject to revision.

5.22. Solubility of $\text{Nd}_2(\text{SO}_4)_3$ in 0.02 m UO_2SO_4 Solution Containing 0.005 m H_2SO_4 (180–300°C)

R. E. Leuze *et al.*, HRP Quar. Prog. Rep. April 30, 1954, ORNL-1753, p 176–79.

Also included in the reference are preliminary solubility data for rare earth sulfate mixtures as well as $\text{Ce}_2(\text{SO}_4)_3$ and $\text{La}_2(\text{SO}_4)_3$ in 0.02 m UO_2SO_4 , 0.005 m H_2SO_4 .

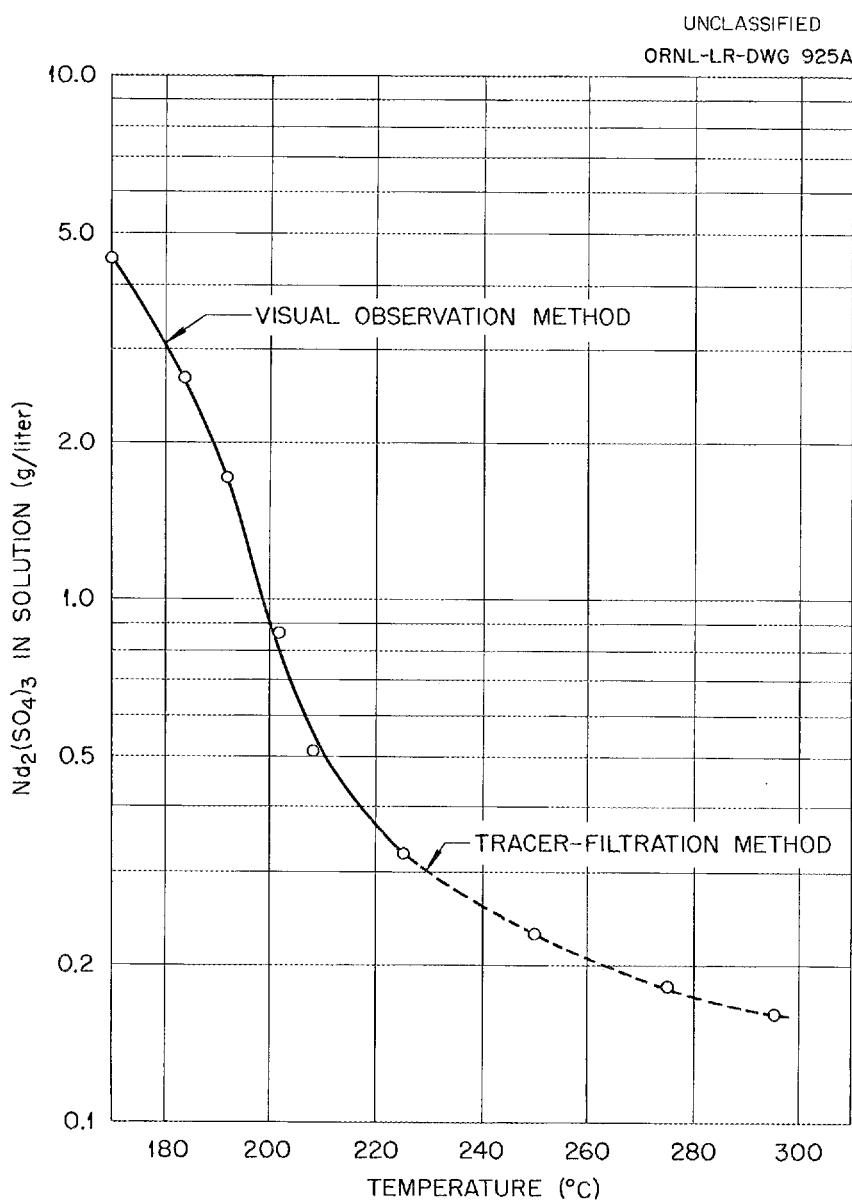

Fig. 5.22. Solubility of $\text{Nd}_2(\text{SO}_4)_3$ in 0.02 m UO_2SO_4 Solution Containing 0.005 m H_2SO_4 (180–300°C).

5.23. Solubility of $\text{La}_2(\text{SO}_4)_3$ in UO_2SO_4 Solutions

E. V. Jones, M. H. Lietzke, and W. L. Marshall, *J. Am. Chem. Soc.* **79**, 267 (1957); also *The Solubility of Several Metal Sulfates at High Temperatures and Pressures in Water and in Aqueous Uranyl Sulfate Solution*, ORNL CF-55-7-69 (declassified Aug. 23, 1955).

Experimental data for Figs. 5.23–5.27 were obtained by the visual-synthetic method described in Sec 5.8. The very large effect of UO_2SO_4 must be noted and indicates considerable solvation of other species by aqueous UO_2SO_4 .

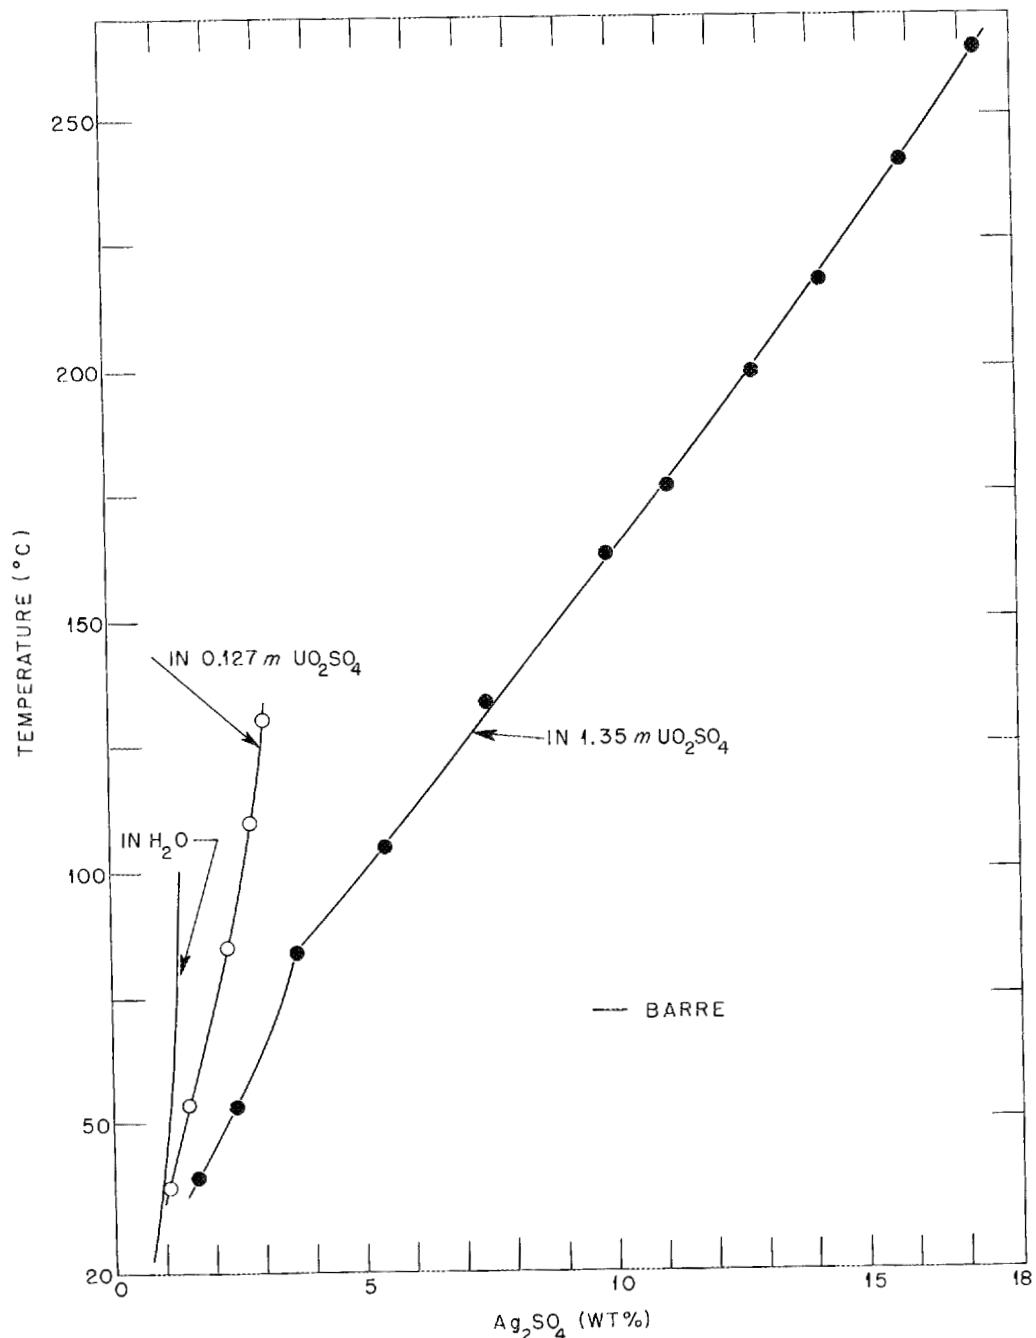

Fig. 5.27. Solubility of Ag_2SO_4 in UO_2SO_4 Solutions.

5.28. Solubility at 250°C of BaSO₄ in UO₂SO₄-H₂O Solutions

E. V. Jones, M. H. Lietzke, and W. L. Marshall, *J. Am. Chem. Soc.* **79**, 267 (1957); also *The Solubility of Several Metal Sulfates at High Temperatures and Pressures in Water and in Aqueous Uranyl Sulfate Solutions*, ORNL CF-55-7-69 (declassified Aug. 23, 1955).

Solutions were filtered from solids at 250°C to obtain the solubility of BaSO₄ in H₂O. Counting of radioactive barium was used to determine the solubility concentration. The very large effect of UO₂SO₄ must be noted and indicates considerable solvation of other species by aqueous UO₂SO₄.

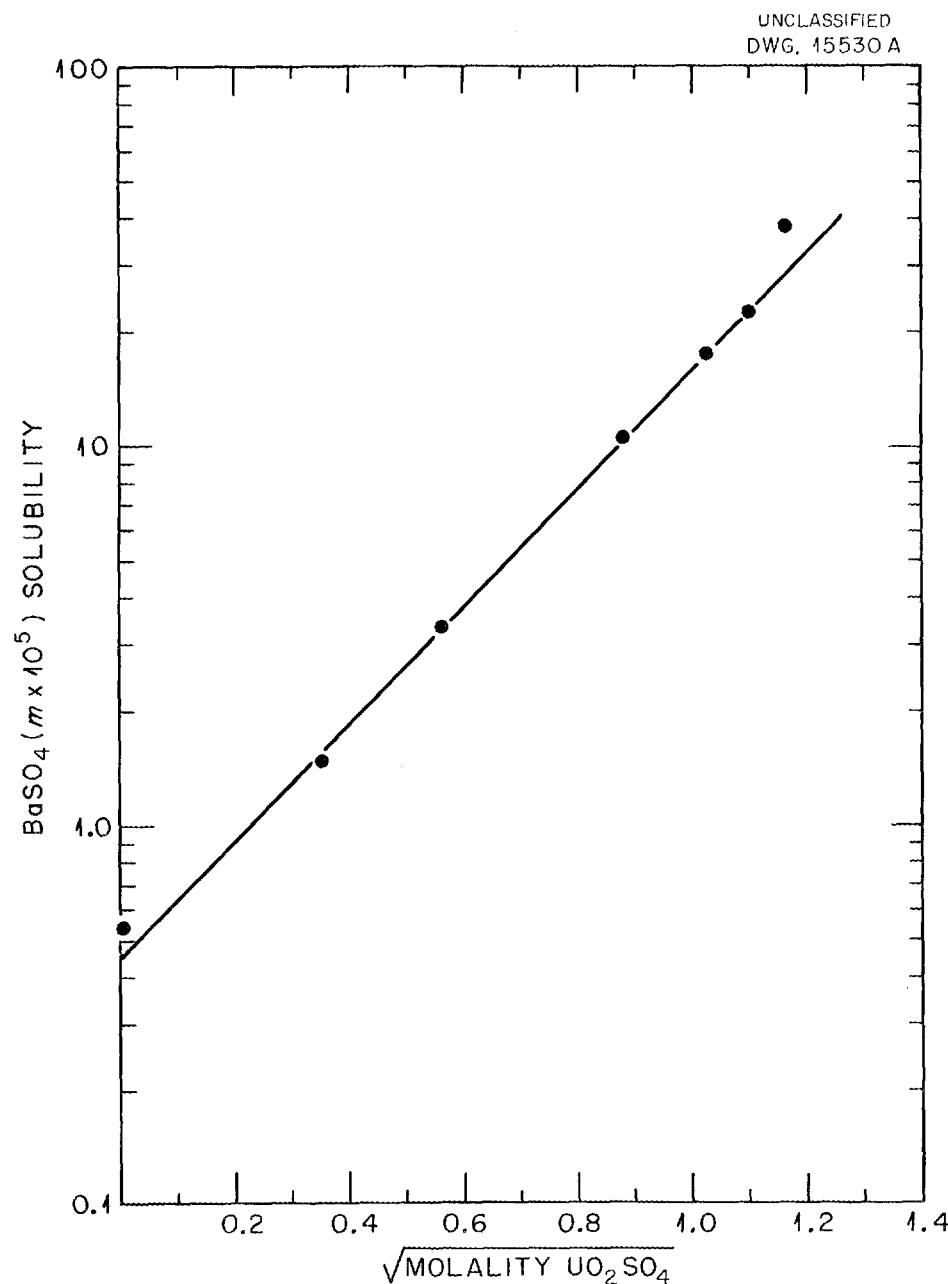

Fig. 5.28. Solubility at 250°C of BaSO₄ in UO₂SO₄-H₂O Solutions.

5.29. Solubility of H_2WO_4 in 0.126 and 1.26 M UO_2SO_4

C. E. Coffey, W. L. Marshall, and G. H. Cartledge, *HRP Quar. Prog. Rep.* Oct. 31, 1953, ORNL-1658, p 96-99.

The data shown in the figures were obtained by direct sampling of equilibrated solutions, by the filter bomb method, and by the synthetic method described previously in Sec 5.8. In 0.126 M UO_2SO_4 the solubility of H_2WO_4 first shows a positive temperature coefficient of solubility and then, above 100°C, a negative coefficient of solubility. In 1.26 M UO_2SO_4 the temperature coefficient of solubility is positive up to 285°, the temperature at which two liquid phases form - a characteristic of UO_2SO_4 - H_2O solutions.

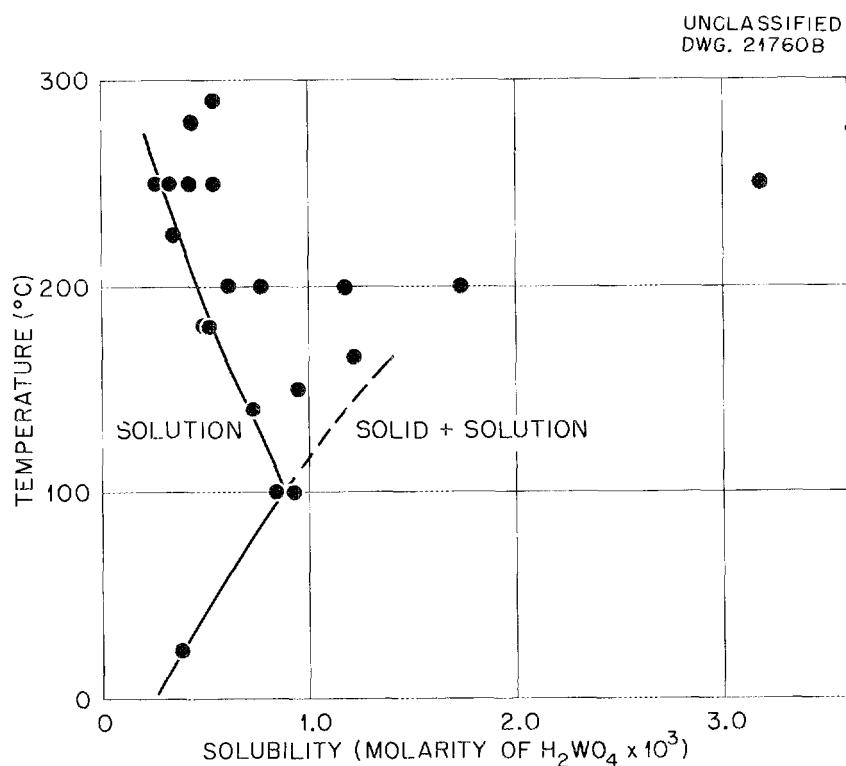

Fig. 5.29a. Solubility of H_2WO_4 in 0.126 M UO_2SO_4 .

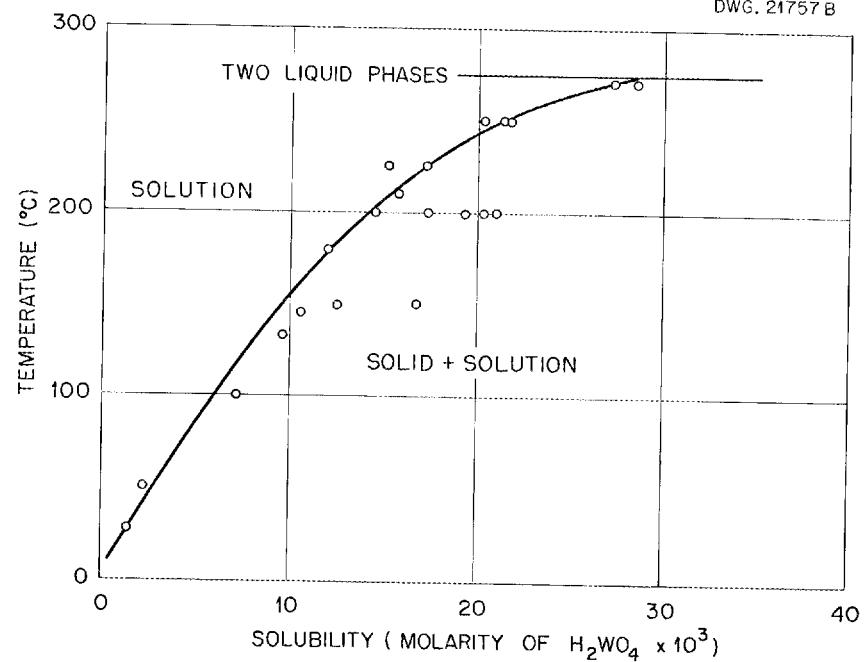

Fig. 5.29b. Solubility of H_2WO_4 in 1.26 M UO_2SO_4 .

5.30. Phase Stability of H_2WO_4 in 1.26 M UO_2F_2

C. E. Coffey, W. L. Marshall, and G. H. Cartledge, *HRP Quar. Prog. Rep.* Oct. 31, 1953, ORNL-1658, p 96-99.

The methods of solubility and stability determination were the same as for analogous studies of H_2WO_4 in UO_2SO_4 (Sec 5.29). The data on the figure as drawn show temperatures at which hydrolytic precipitation of an unidentified solid phase occurs from solutions stable at lower temperatures.

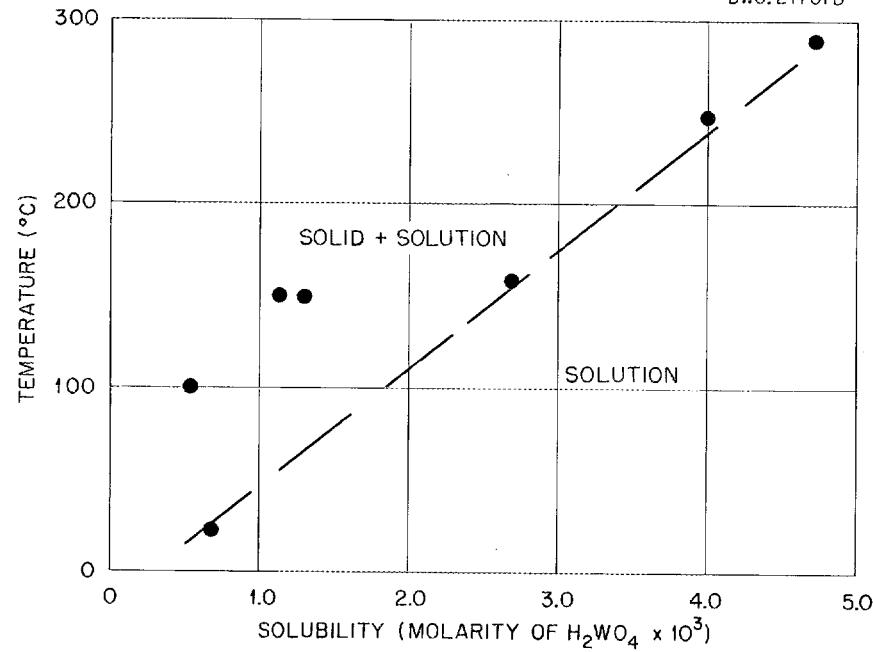

Fig. 5.30. Phase Stability of H_2WO_4 in 1.26 M UO_2F_2 .

5.31. The System $\text{UO}_2(\text{NO}_3)_2\text{-H}_2\text{O}$

1. Reported in full by W. L. Marshall, J. S. Gill, and C. H. Secoy, *Chem. Quar. Prog. Rep.* March 31, 1951, ORNL-1053, p 22-25.

2. Reported in part by W. L. Marshall, J. S. Gill, and C. H. Secoy, *J. Am. Chem. Soc.* **73**, 1867 (1951).

As in the case of the system $\text{UO}_2\text{SO}_4\text{-H}_2\text{O}$, hydrolysis occurs at high temperatures and low concentrations, resulting in precipitation of $\text{UO}_3\cdot\text{H}_2\text{O}$ from stoichiometric $\text{UO}_2(\text{NO}_3)_2$ solutions. In addition, decomposition of NO_3^- occurs at elevated temperature to produce an equilibrium vapor phase of nitrogen oxides. Letter A represents a region of complete solution. Data at low temperature up to point F were obtained by direct analysis of equilibrated solutions, whereas the high-temperature data were obtained by the visual-synthetic method described in Sec 5.8.

UNCLASSIFIED
DWG. 10868

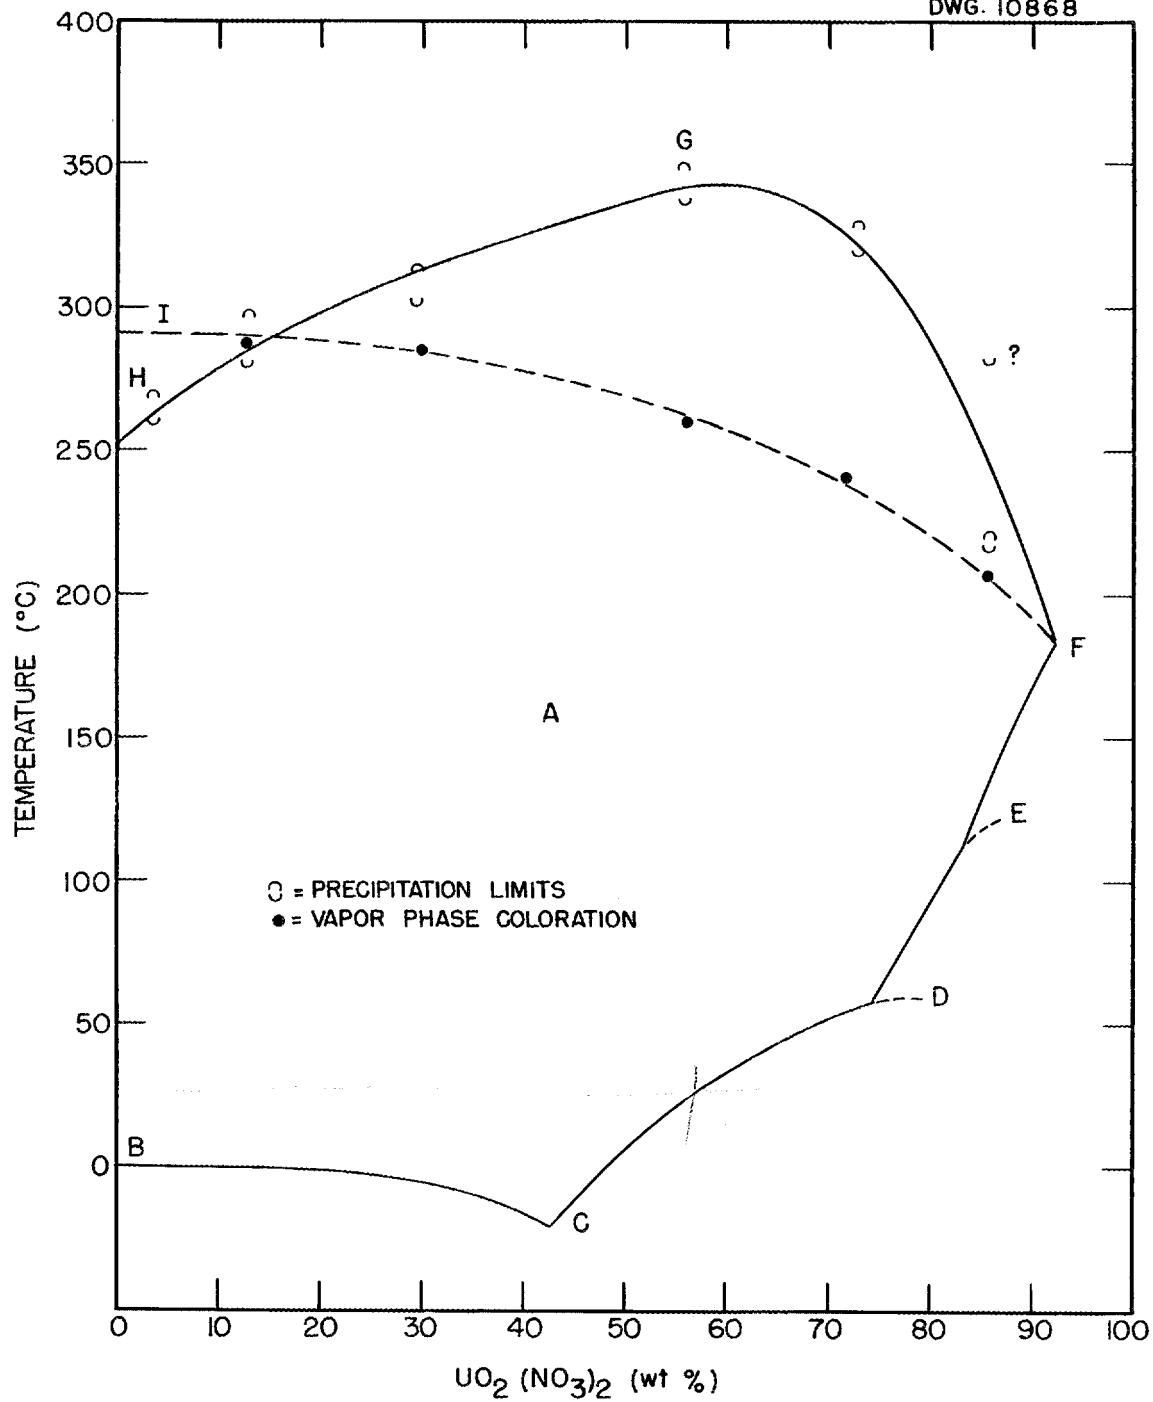

Fig. 5.31. The System $\text{UO}_2(\text{NO}_3)_2 - \text{H}_2\text{O}$.

5.32. Phase Equilibria of UO_3 and HF in Stoichiometric Concentrations (Aqueous System)

W. L. Marshall, J. S. Gill, and C. H. Secoy, *J. Am. Chem. Soc.* **76**, 4279 (1954).

The two-liquid-phase region and the region of "basic" solid solution + saturated solution are in actuality segments of the three-component system $\text{UO}_3\text{-HF-H}_2\text{O}$, in which the equilibrium phases are nonstoichiometric with regard to UO_2F_2 . This system is somewhat analogous to the system $\text{UO}_3\text{-H}_2\text{SO}_4\text{-H}_2\text{O}$ (see Sec 5.7).

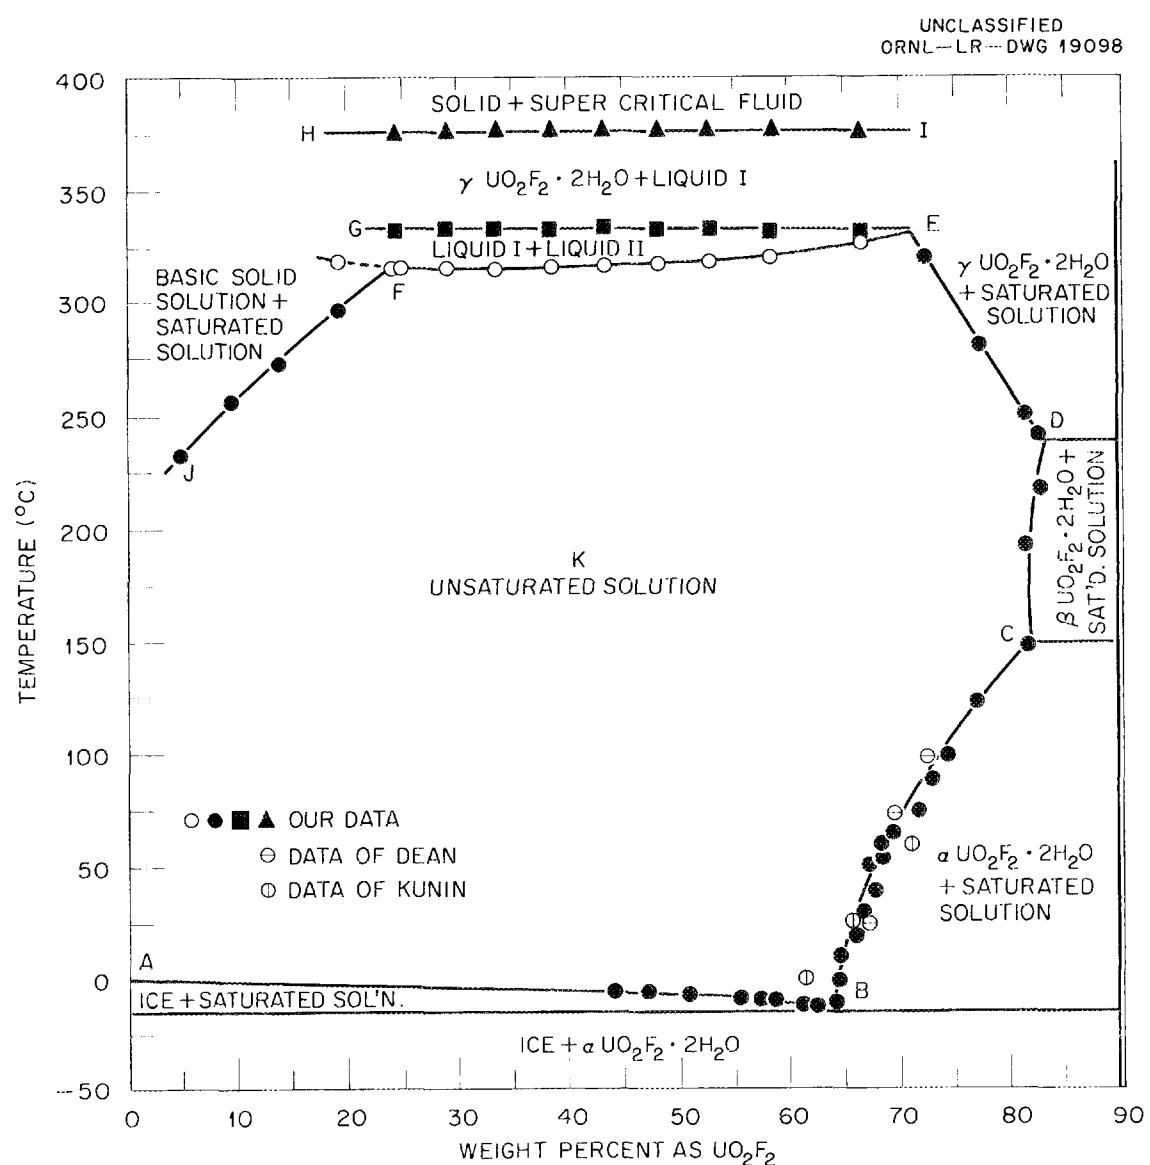

Fig. 5.32. Phase Equilibria of UO_3 and HF in Stoichiometric Concentrations (Aqueous System).

5.33. Solubility of Uranium Trioxide in Orthophosphoric Acid Solutions

W. L. Marshall, J. S. Gill, and H. W. Wright, *HRP Quar. Prog. Rep.* May 15, 1951, ORNL-1057, p 112-15.

The data were obtained for the most part by equilibrating solutions of known concentration in sealed tubes for various times at different temperatures. Phase changes were observed visually.

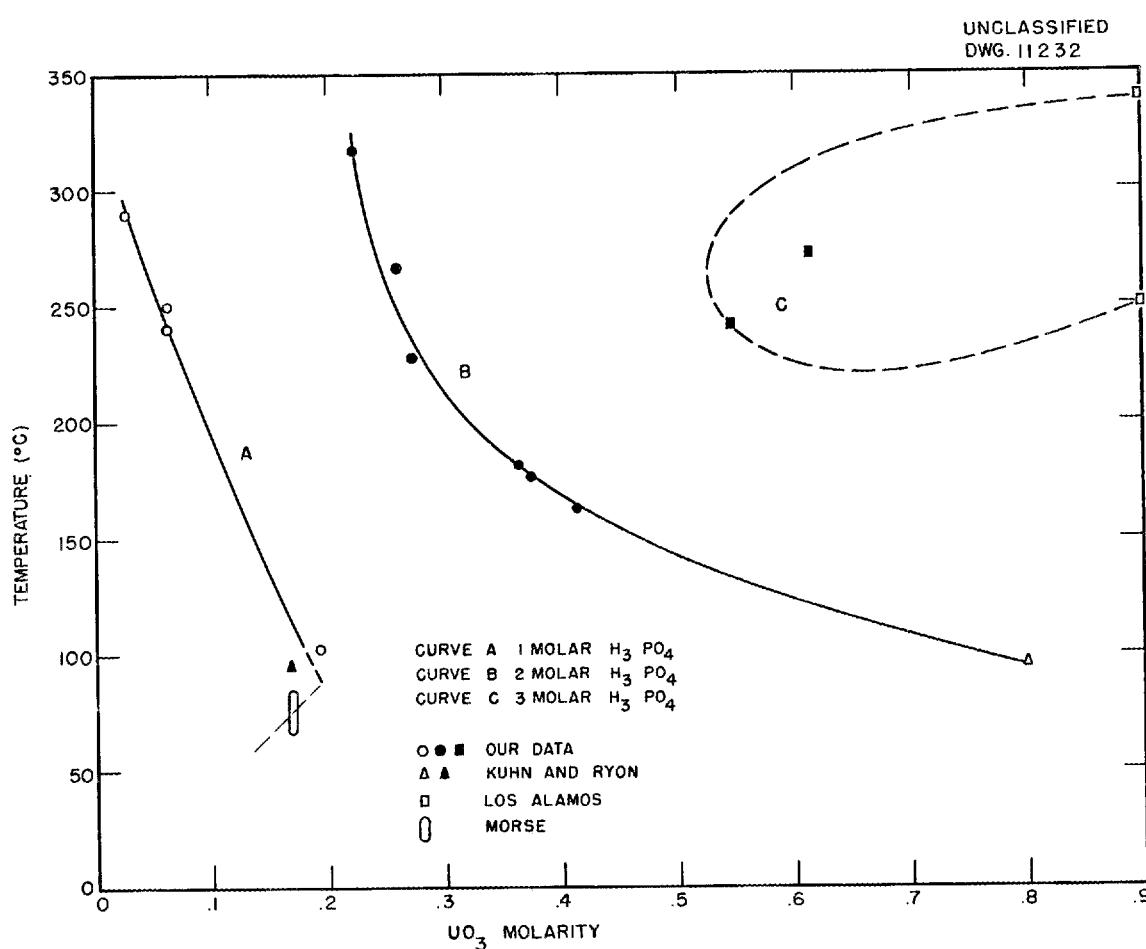

Fig. 5.33. Solubility of Uranium Trioxide in Orthophosphoric Acid Solutions.

5.34. Solubility of Uranium Trioxide in Phosphoric Acid at 250°C

J. S. Gill, W. L. Marshall, and H. W. Wright, *HRP Quar. Prog. Rep.* Aug. 15, 1951, ORNL-1121, p 119-21.

Solution and solid mixtures were equated at 250°C in sealed glass tubes. The tubes were cooled rapidly to room temperature, and the solution and solid phases were analyzed. The slow reversibility of equilibrium conditions made this procedure possible.

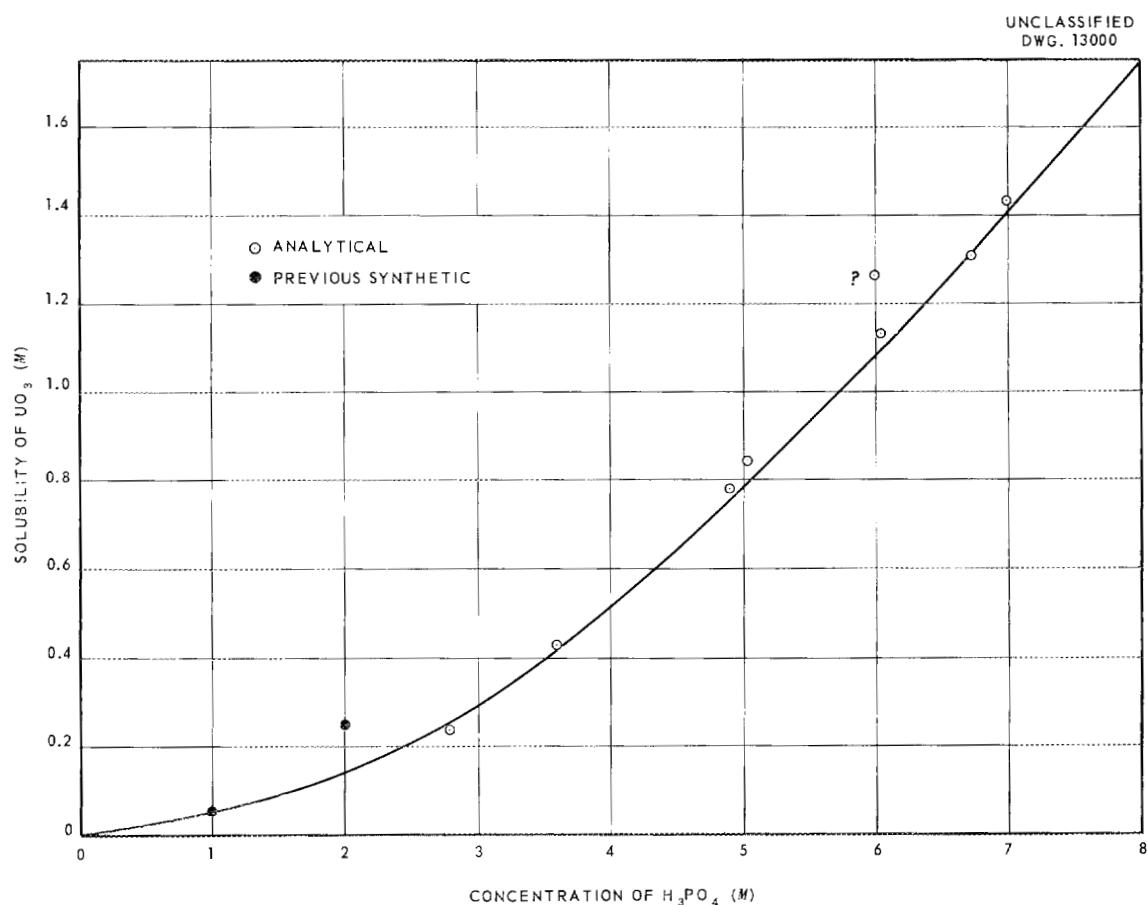

Fig. 5.34. Solubility of Uranium Trioxide in Phosphoric Acid at 250°C.

5.35. Solubility of UO_3 in H_3PO_4 Solution

B. J. Thamer *et al.*, *The Properties of Phosphoric Acid Solutions of Uranium as Fuels for Homogeneous Reactors*, LA-2043 (March 6, 1956); W. L. Marshall, J. S. Gill, and H. W. Wright, *HRP Quar. Prog. Rep. May 15, 1951*, ORNL-1057, p 112-15; and J. S. Gill, W. L. Marshall, and H. W. Wright, *HRP Quar. Prog. Rep. Aug. 15, 1951*, ORNL-1121, p 119-21.

This figure represents a compilation from the data of B. J. Thamer *et al.* of Los Alamos and W. L. Marshall *et al.* of Oak Ridge National Laboratory.

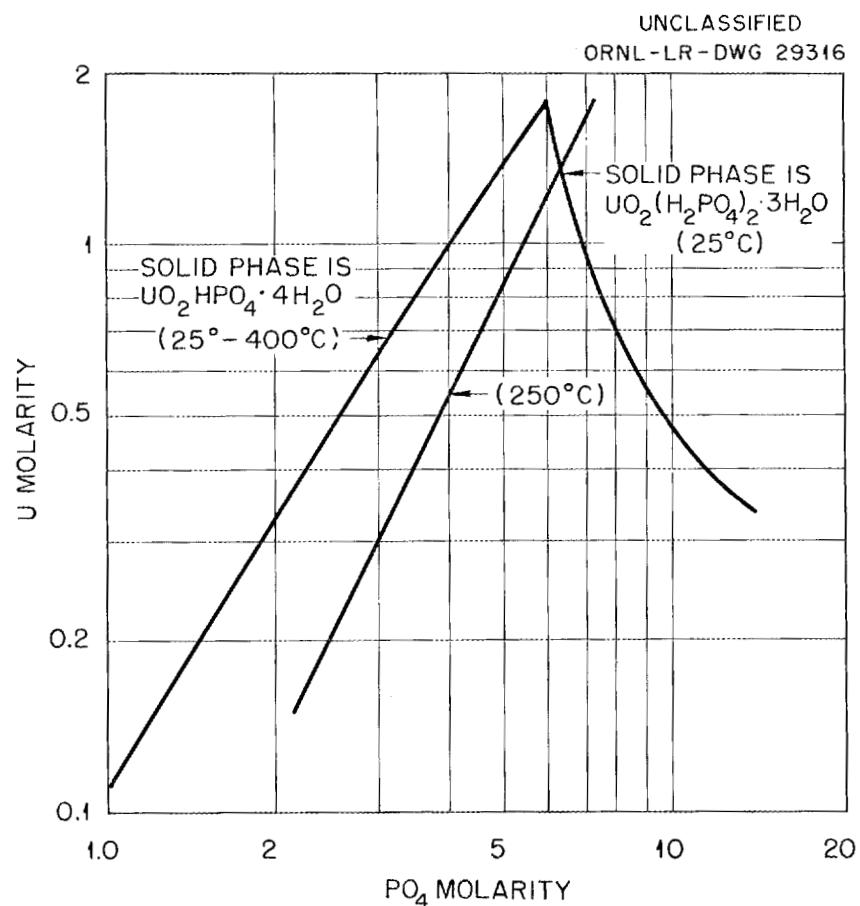

Fig. 5.35. Solubility of UO_3 in H_3PO_4 Solution.

5.36. The System $\text{UO}_2\text{CrO}_4\text{-H}_2\text{O}$

1. F. J. Loprest, W. L. Marshall, and C. H. Secoy, *J. Am. Chem. Soc.* **77**, 4705 (1955).

2. W. L. Marshall, *HRP Quar. Prog. Rep.* March 31, 1953, ORNL-1554, p 105-6.

The solid phases are $\text{UO}_2\text{CrO}_4 \cdot 5\frac{1}{2}\text{H}_2\text{O}$ (A) and $\text{UO}_2\text{CrO}_4 \cdot x\text{H}_2\text{O}$ (B). Curve rs represents the boundary of a region in which hydrolytic precipitation of a basic uranyl chromate occurs. In the same concentration range the dichromate, $\text{UO}_2\text{Cr}_2\text{O}_7$, is stable to the critical temperature and apparently dissolves in the supercritical fluid (ref 2).

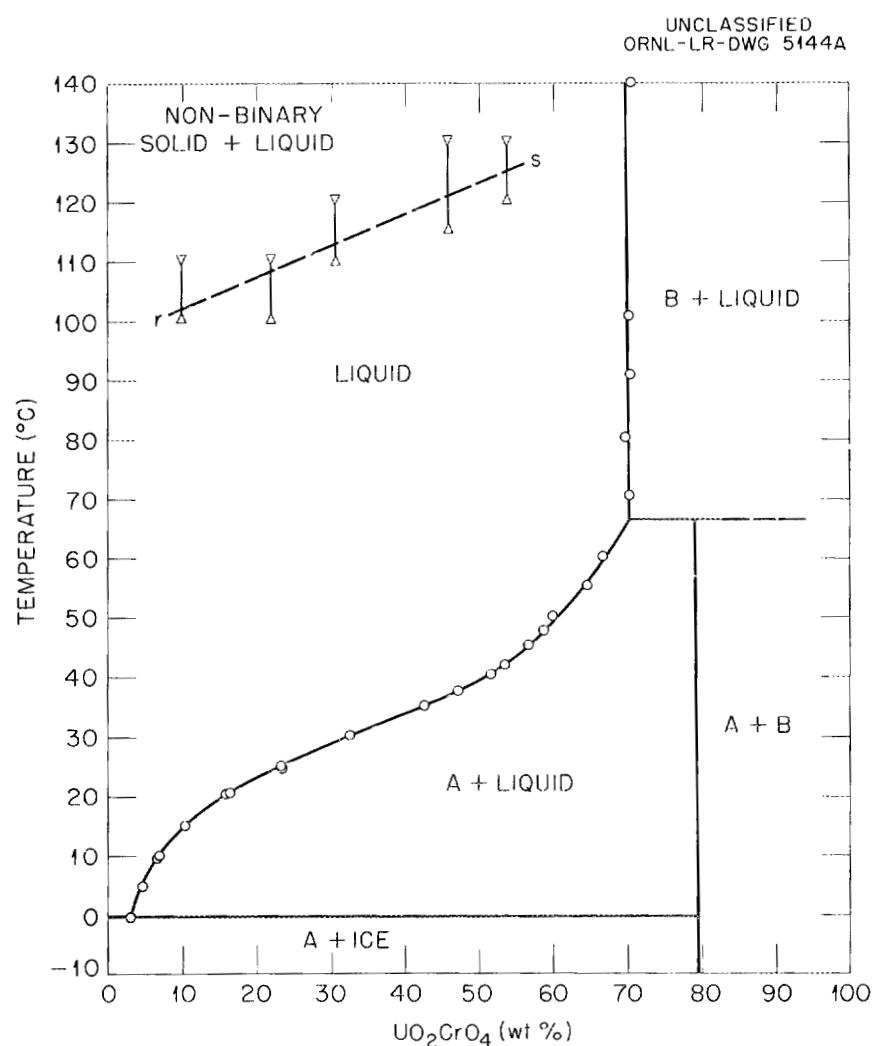

Fig. 5.36. The System $\text{UO}_2\text{CrO}_4\text{-H}_2\text{O}$.

5.37. Variation of Li_2CO_3 Solubility with UO_2CO_3 Concentration at Constant CO_2 Pressure (250°C)

1. F. J. Loprest, W. L. Marshall, and C. H. Secoy, *HRP Quar. Prog. Rep. July 31, 1955*, ORNL-1943, p 227-35.

2. W. L. Marshall, F. J. Loprest, and C. H. Secoy, *HRP Quar. Prog. Rep. Jan. 31, 1956*, ORNL-2057, p 131-32.

The solubility relationships in the figure indicate strong complexing of UO_2CO_3 with Li_2CO_3 under CO_2 pressure. The formation of HCO_3^- species in solution is indicated.

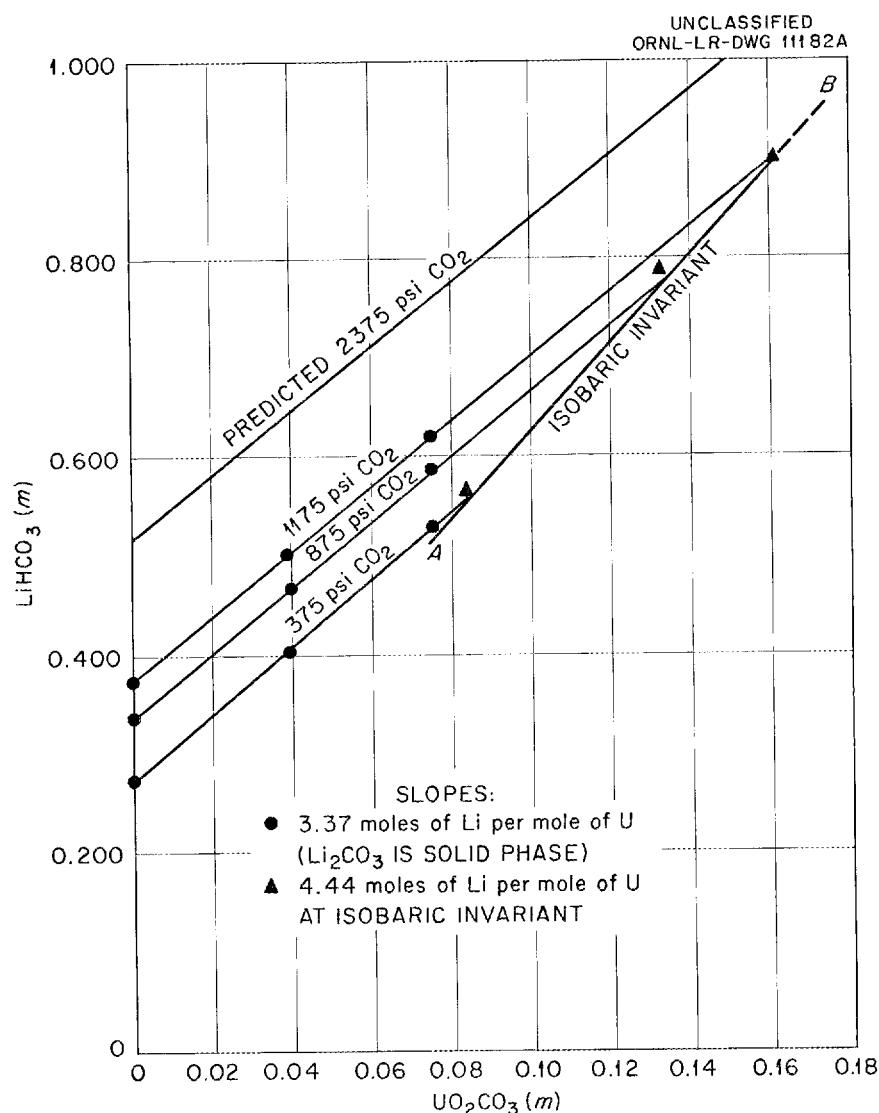

Fig. 5.37. Variation of Li_2CO_3 Solubility with UO_2CO_3 Concentration at Constant CO_2 Pressure (250°C).

5.38. The System $\text{Li}_2\text{O}-\text{UO}_3-\text{CO}_2-\text{H}_2\text{O}$ at 250°C and 1500 psi

1. F. J. Loprest, W. L. Marshall, and C. H. Secoy, *HRP Quar. Prog. Rep.* July 31, 1955, ORNL-1943, p 227-35.

2. W. L. Marshall, F. J. Loprest, and C. H. Secoy, *HRP Quar. Prog. Rep.* Jan. 31, 1956, ORNL-2057, p 131-32.

As CO_2 pressure is increased, the area of complete solution (indicated by the shading) increases. As temperature is increased, the solution area decreases.

UNCLASSIFIED
ORNL-LR-DWG 11342B

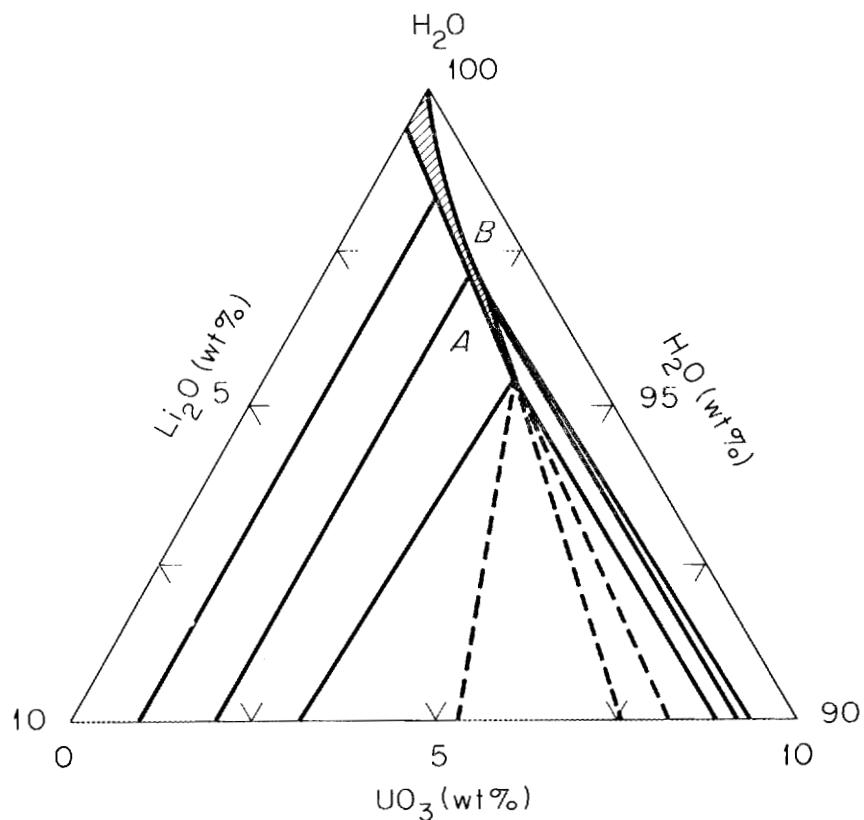

Fig. 5.38. The System $\text{Li}_2\text{O}-\text{UO}_3-\text{CO}_2-\text{H}_2\text{O}$ at 250°C and 1500 psi.

5.39. The System $\text{Th}(\text{NO}_3)_4\text{-H}_2\text{O}$

1. Reported in full by W. L. Marshall, J. S. Gill, and C. H. Secoy, *HRP Quar. Prog. Rep.* Nov. 30, 1950, ORNL-925, p 279-90.

2. W. L. Marshall, J. S. Gill, and C. H. Secoy, *J. Am. Chem. Soc.* **73**, 4991 (1951).

Hydrolytic precipitation of ThO_2 and thermal decomposition of NO_3^- in this system occur in an analogous manner to the reactions occurring in the system $\text{UO}_2(\text{NO}_3)_2\text{-H}_2\text{O}$ (see Sec 5.31). At higher temperatures the two-component system in actuality must be considered in terms of the three components ThO_2 , HNO_3 , and H_2O .

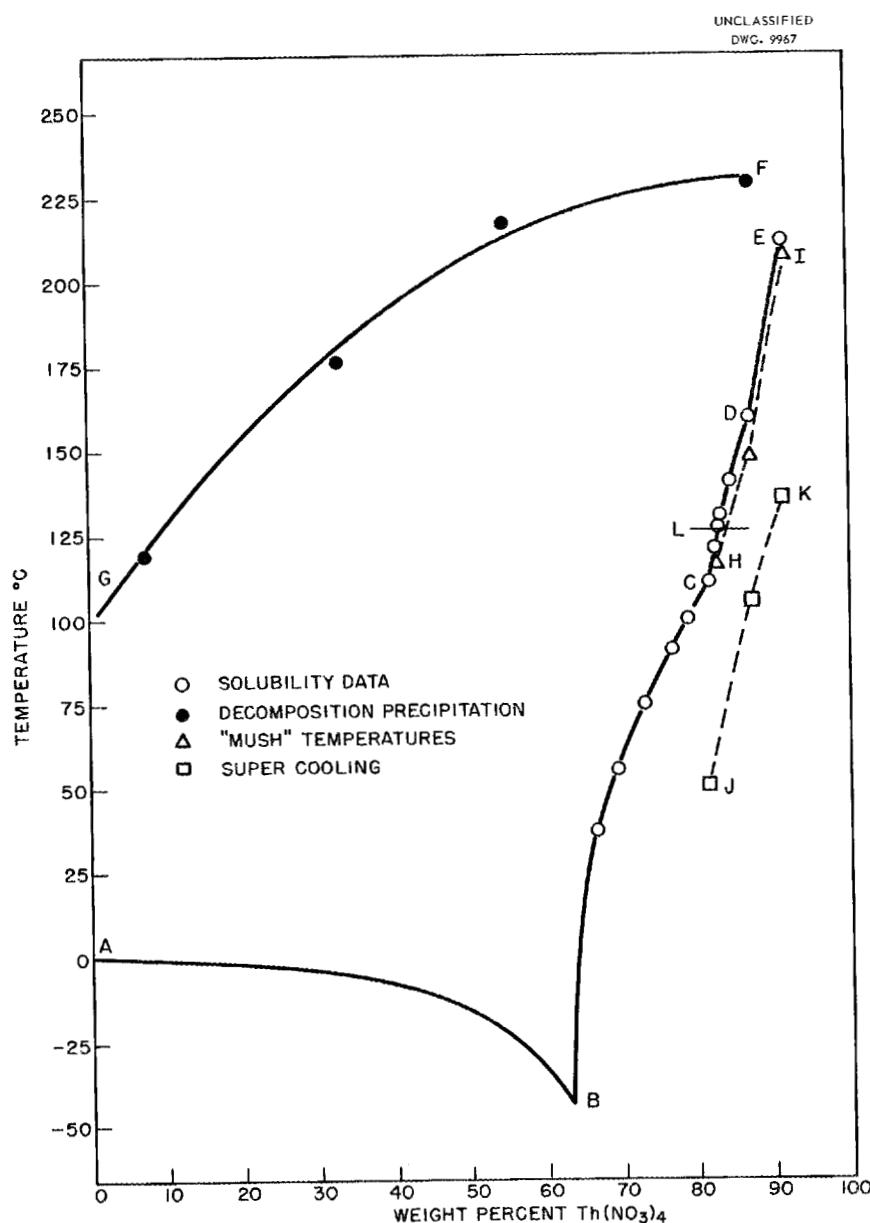

Fig. 5.39. The System $\text{Th}(\text{NO}_3)_4\text{-H}_2\text{O}$.

5.40. Hydrolytic Stability of Thorium Nitrate–Nitric Acid and Uranyl Nitrate Solutions

1. W. L. Marshall and C. H. Secoy, *HRP Quar. Prog. Rep.* Oct. 31, 1953, ORNL-1658, p 93–96.

2. W. L. Marshall, J. S. Gill, and C. H. Secoy, *Chem. Quar. Prog. Rep.* March 31, 1951, ORNL-1053, p 22–25.

The data used to draw the individual curves were obtained by observations at various temperatures of tubes that contained different solutions of known concentration. The procedure was analogous to that used for obtaining data for Fig. 5.33. The curve for hydrolytic precipitation of $\text{UO}_2(\text{NO}_3)_2$ is taken from ref 2.

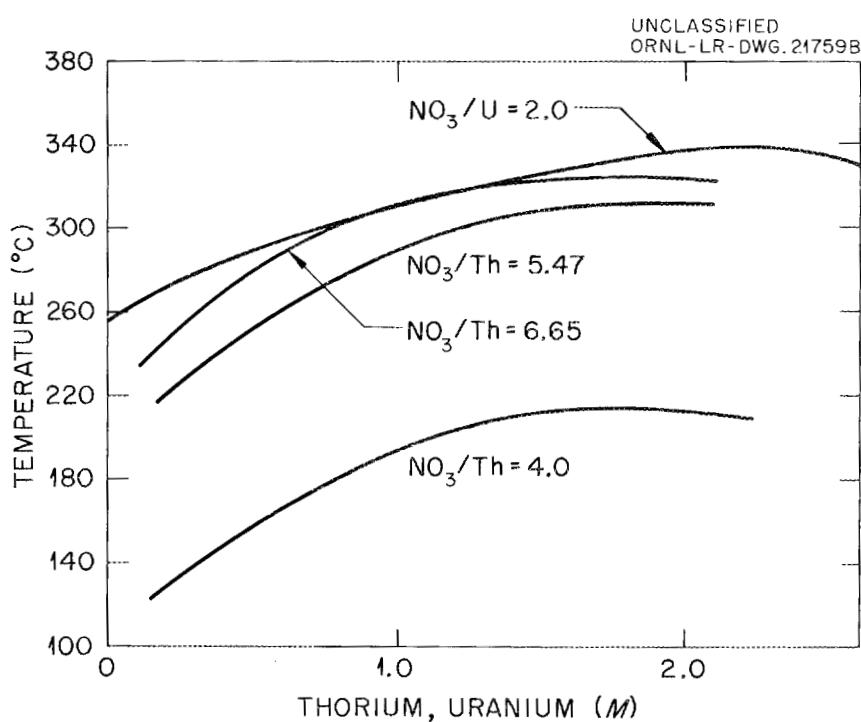

Fig. 5.40. Hydrolytic Stability of Thorium Nitrate–Nitric Acid and Uranyl Nitrate Solutions.

5.41. The System $\text{ThO}_2\text{-CrO}_3\text{-H}_2\text{O}$ at 25°C

1. H. T. S. Britton, *J. Chem. Soc.* 123, 1429 (1923).
2. W. L. Marshall, F. J. Loprest, and C. H. Secoy, *HRP Quar. Prog. Rep. Jan. 31, 1955*, ORNL-1853, p 205-6.

The phase diagram at 25° was determined by Britton. Points 1-7 indicate compositions investigated at high temperature by Marshall, Loprest, and Secoy. These solution compositions were phase stable up to 160°C for point 7 and 320°C for point 1.

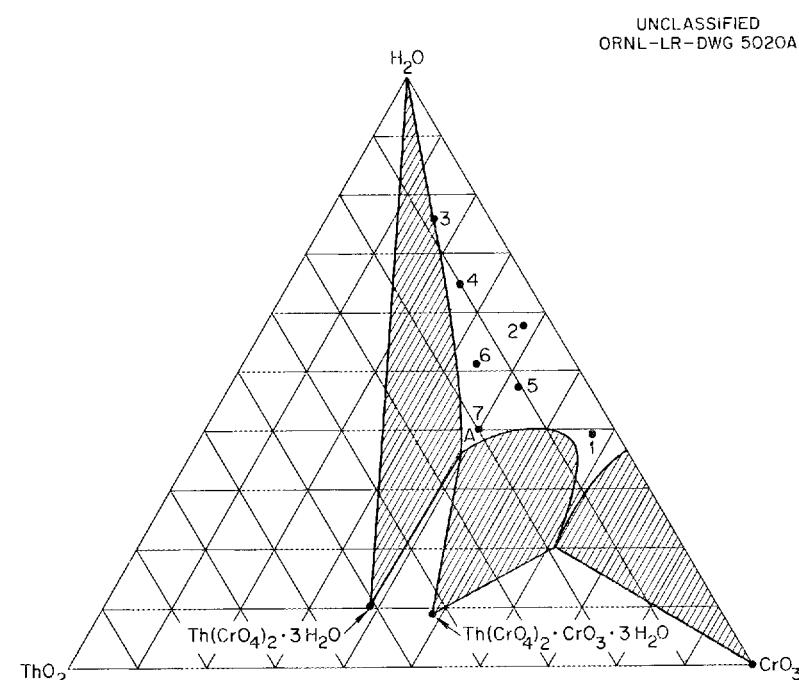

Fig. 5.41. The System $\text{ThO}_2\text{-CrO}_3\text{-H}_2\text{O}$ at 25°C. Compositions are in weight per cent.

5.42. Phase Stability of $\text{ThO}_2\text{-H}_3\text{PO}_4\text{-H}_2\text{O}$ Solutions at High Concentrations of ThO_2

W. L. Marshall, experimental data in ORNL research notebook 2881, p 35 (May 1953).

Solutions of appropriate concentrations were prepared and analyzed. These solutions were sealed in glass tubes and shaken at various temperatures for times varying from 1 hr to several days. In this manner the phase stability boundaries with respect to concentration and temperature were established. At first inspection of the figure it is surprising that more ThO_2 can be dissolved per liter at the lower $\text{H}_3\text{PO}_4/\text{ThO}_2$ ratio than at the higher ratio. Actually, there is a physical volume limitation due to the high fractional volumes occupied by ThO_2 and H_3PO_4 at these concentrations. As any solution is diluted with H_2O , hydrolysis of thorium in solution occurs. At room temperature, solutions in which the $\text{H}_3\text{PO}_4/\text{ThO}_2$ ratio is 5:1 are gels, whereas 10:1 ratio solutions are still fluid.

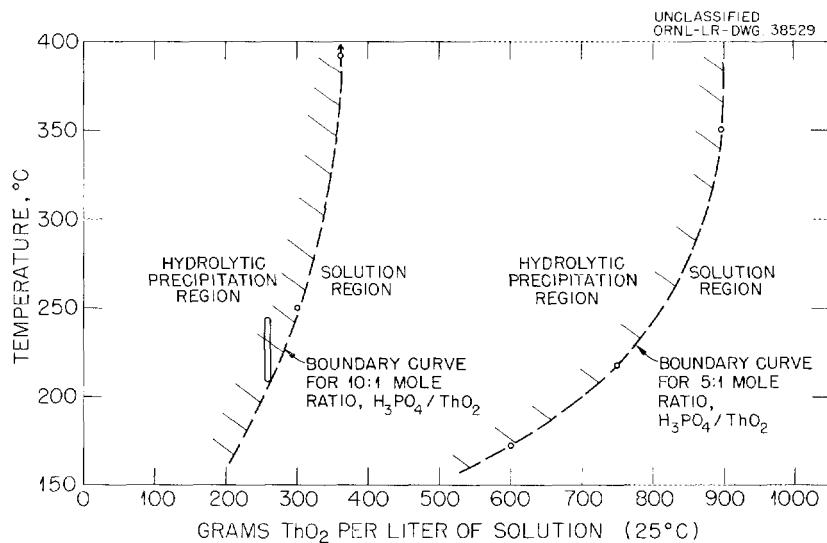

Fig. 5.42. Phase Stability of $\text{ThO}_2\text{-H}_3\text{PO}_4\text{-H}_2\text{O}$ Solutions at High Concentrations of ThO_2
