

Local electrode atom probe characterizations of neutron irradiated RPV steels and model alloys

M.K. Miller and K.F. Russell

The ORNL local electrode atom probe has been used to characterize the microstructure of several irradiated reactor pressure vessel steels.

Research at the SHaRE User Facility was sponsored by the Division of Materials Sciences and Engineering, U. S. Department of Energy, under Contract DE-AC05-00OR22725 with UT-Battelle, LLC.
