**Equilibrium Basal-plane Magnetization of Superconductive YNi<sub>2</sub>B<sub>2</sub>C - the Influence of Non-local Electrodynamics<sup>1</sup>**

J.R. THOMPSON, University of Tennessee and Oak Ridge National Lab, A.V. SILHANEK, L. CIVALE, Centro Atomico Bariloche and Instituto Balseiro, K.J. SONG, University of Tennessee, C.V. TOMY, D. MCK. PAUL, University of Warwick, Coventry, CV4 7AL, UK — For a single crystal of YNi<sub>2</sub>B<sub>2</sub>C superconductor, the equilibrium magnetization  $M$  in the square basal plane has been studied experimentally as a function of temperature and magnetic field. While the magnetization  $M(H)$  deviates from conventional London predictions, a recent extension of London theory (to include effects of non-local electrodynamics) describes the experiments accurately. The resulting superconductive parameters are well behaved and yield a mass anisotropy ratio  $\gamma = \sqrt{m_c/m_a} = 1.14$ . These experimental results are compared both with corresponding findings for the case with  $M$  perpendicular to the basal plane and with the predictions of band structure calculations.

<sup>1</sup>Research at ORNL was sponsored by the U.S. DOE under contract DE-AC05-00OR22725 with UT-Battelle, LLC.
