Research Synopsis

1. *Quantum excitations at the nanoscale*
The fundamentals of energy dynamics and excitations unique to the nanoscale and quantum materials are discovered from atomic scale spectroscopies and transport.
2. *Atomic structure of oxide surfaces and interfaces*
Understanding and control of properties in oxide thin films and interfaces depend critically on the atomic structure, which we explore using scanning tunneling and non-contact force microscopies.

3. *Transport in non-metallic oxides*

The transport of electrons in thin oxide films is mapped at nanometer length scales as a function of temperature, applied voltage, and internal polarization in ultra high vacuum.
